

# Tyhee Gold Corp. Drills 8.2 Metres of 12.46 grams of Gold per tonne at Yellowknife Gold Project, NWT Canada

24.03.2011 | [CNW](#)

VANCOUVER, March 24 /CNW/ - [Tyhee Gold Corp.](#) (TSXV: TDC) (the "Company"), a late stage development company, is pleased to announce that diamond drilling continues to expand the Main Zone at Clan Lake. In addition a second drill is completing infill drilling at the Ormsby Zone, providing more details in an area where only limited reserves had been defined in the positive Preliminary Feasibility Study released July 2010.

"The results from the Clan Lake Main Zone continue to be encouraging" reports Dr. Webb, President and CEO. "Gold mineralization continues to be developed to the east of the established resource and the company is testing its width at this point. The drill results include 13.0 metres (m) of 0.72 grams per tonne (gpt) gold in CL188, 8.0 m of 0.79 gpt gold including 2.0 m of 2.34 gpt gold in CL189.

The Ormsby drilling is targeting an area 270 metres north of the large open pit that was defined in the Preliminary Feasibility Study. In this location the mineralization, which primarily occurs on the eastern side of the volcanic rocks, is also found on the western side. To the north the entire volcanic pile hosts mineralization for a further 450 metres. Drill results include 41.0 m of 2.66 gpt gold including 8.2 m of 12.46 gpt gold in NDM565, 3.0 m of 3.72 gpt in NDM562 and 6.3 m of 1.87 gpt gold including 4.3 m of 2.40 gpt gold in NDM 563."

Diamond drilling continues with two drills completing infill drilling on the Ormsby Zone north of the established reserves. In the near term one drill will be moved back to Clan Lake to complete expansion drilling of the resources north and southeast of the ore reserves established at Clan Lake and defined by the Preliminary Feasibility Study.

Tyhee Gold Corp. is actively moving its wholly-owned Yellowknife Gold Project towards production with a defined resource of 2 million ounces of gold in its Measured and Indicated categories and including a Proven and Probable Reserve of over 800,000 ounces of gold. A positive Preliminary Feasibility Study has been completed and applications to construct and operate a 3,000 tonne per day mine and mill complex have been submitted to regulatory authorities. Tyhee is moving towards the final stages of this review process with the submission of the environmental assessment study to occur within the next two months.

Tyhee completes fire assays on drill core samples using 30 gram aliquots with ICP-ES finish for gold analyses. Samples are prepared at Acme Analytical Laboratories Ltd. in Yellowknife, and finished at Acme Analytical Laboratories Ltd in Vancouver. As well, a semi-quantitative multi-element analysis is run on 0.5 gm aliquot samples leached in a hot aqua regia solution and measured using ICP-ES techniques. Tyhee conducts a rigorous QA/QC program of inserting blanks and duplicates in the field and standards in the laboratory. The laboratory also conducted their own independent QA/QC program including inserting their own standards and rerunning samples from pulped material and reject material. These results were provided to Tyhee. All standards, duplicates, blanks and check assays returned acceptable results. Mr. V. Pratico, P.Geol., the designated QP within the meaning of NI 43-101, has reviewed this release and approves of its content.
