

Great Bear Resources Ltd. Completes Phase 1 Drilling at Dixie Lake

09.08.2017 | [Newsfile](#)

Vancouver, August 9, 2017 - [Great Bear Resources Ltd.](#) (TSXV: GBR) (the "Company" or "Great Bear"), today announced it has completed Phase 1 drilling at the Dixie Lake gold project in the Red Lake district of Ontario.

The Company completed 1047 metres of drilling with eight diamond drill holes along 450 metres of strike of the main mineralized zone on the project. Drill holes tested mineralization between approximately 30 and 110 metres vertically from surface. Drill core has been submitted for assay and the Company is expecting to receive results within approximately four weeks.

Drill holes were planned to answer the following questions:

- 1) Is the mineralized zone controlled by particular geological units or rather by deep-seated structure that cuts all units, and
- 2) Does mineralization appear to be continuous between historic and current drilling?

Great Bear's geologists noted that mineralization appears to be predominantly structurally controlled, and is hosted by a variety of lithologies, including volcanic and sedimentary units. All drill holes encountered mineralization in the form of silicification and local brecciation plus various sulphide minerals.

Results to date support a steeply-dipping, structurally controlled gold mineralized system similar to most deposits in the Red Lake district. Mineralization appears continuous between historic and current drill intercepts, and is known to extend from surface to over 500 metres vertically where it remains open to extension. The mineralized zone has been historically drilled and trenched along approximately 1.5 kilometres of strike.

The Company will provide guidance on Phase 2 drilling once assays have been received.

Mr. R. Bob Singh, P.Geo, Director and VP Exploration for Great Bear, is the Qualified Person as defined by National Instrument 43-101 responsible for the accuracy of technical information contained in this news release.
