## Moneta Reports Improved Metallurgical Gold Recoveries

14.01.2020 | CNW

TSX: ME

TORONTO, Jan. 14, 2020 - Moneta Porcupine Mines Inc. (TSX:ME) (OTC:MPUCF) (XETRA:MOP) ("Moneta" or the "Opleased to announce the results of gold recovery test work conducted on drill core samples from the South West deposition of the Highway Project, located 110 km east of Timmins, Ontario, (see Figure 1).

## Highlights:

Metallurgical gold recovery test work showed increased gold recoveries from drill core from the South West deposit inc November 2019 Mineral Resource Estimate:

- Gold recoveries (gravity and leach) increased to 93.9% at a standard grind size
- Gold recoveries (gravity and leach) increased to 95.5% at a finer grind size
- Gravity recovery of gold averaged 50.6%
- Whole ore leach gold recoveries increased to 93.4% recovery
- Combination of higher head grade and gravity recovery increased recoveries by 1.4% for standard grind and 2.09 grind size
- Optimal recoveries at low CN concentrations (0.5 g/L) with low reagent consumptions

Gary O'Connor, CEO & Chief Geologist commented, "We are pleased that the latest metallurgical gold recovery test-wresulted in higher gold recoveries with no deleterious elements present. The test work indicated gold recoveries of up to 50.6% being recovery by gravity, with standard grind sizes at an estimated head grade of 4.65 g/t Au, and up to 95.5% grind sizes."

The metallurgical gold recovery test-work was conducted to assess the potential gold recoveries and optimum process required to develop the project at a head grade reflective of the latest mineral resource estimate on the South West De release issued November 26, 2019). The test work was conducted on a composite sample collected from 36.20 m of quampled from 2018 and 2019 drill holes completed on the South West deposit (including the Gap Zone). The sample w 33.47 kg with an estimated grade of 4.65 g/t Au based on core assays, selected to be spatially and geologically represented deposit. Metallurgical test work was undertaken by SGS Canada Minerals Lakefield at the SGS Lakefield Laborator

Discussion of South West Gold Metallurgical Test Work Recovery Results

18.05.2025 Seite 1/3

The metallurgical test-work showed that total gold recovery averaging 93.9% was achievable at a 79 micron grind size, of the gold recovered by gravity at a head grade reflective of the updated mineral resource (Table 1). Finer grinding to resulted in an average total gold recovery of 95.5% with 50.6% recovered by gravity (Table 2). Whole ore leaching return recoveries of 93.4%, (Table 3). Optimum recoveries were achieved after 24 hours leaching after gravity recovery, at a concentration of 0.5 g/L, with average laboratory test-work consumption of 1.1 kg/t CN and 1.1 kg/t lime. Lower CN concentration and oxygen addition indicated lower overall recoveries (Table 4).

The test work also confirmed that the composite and process tails contained no elevated levels of deleterious elements test work, also conducted by SGS Canada on composite samples with an average head grade of 0.86 g/t Au without grecovery, showed an average total recovery of 92.5% at the standard grind size and 93.5% on the finer grind under sim laboratory conditions. The combination of a higher head grade and use of gravity recovery has resulted in higher gold refiner grinding also increases the overall gold recovery.

Table 2: Total (Gravity and Leach) Gold Recoveries: Fine Grind

Sample Grind Size Gravity Rec-y CN Conc. Leach Tail Leach Rec-y Head Grade Recovery\*

## QA/QC Procedures

All core drilling conducted by Moneta was oriented. Drill core is cut with half sent to AGAT Laboratories Inc. (AGAT) for crushing to -2 mm, with a 1.00 kg split pulverized to -75  $\mu$ m (200#). AGAT is an ISO 17025 accredited laboratory. A 50 Fire Assayed and analyzed using an AAS finish for Gold. Samples above 10.00 g/t Au are analyzed by Fire Assay with

<sup>\*\*</sup> Oxygen addition

gravimetric finish and selected samples with visible gold or high-grade mineralization are assayed by Metallic Screen F a 1.00 kg sample. Moneta inserts independent certified reference material and blanks with the samples and assays rour epeats and coarse reject sample duplicates, as well as completing third-party check assays at Activation Laboratories Canada Minerals Lakefield conducted the metallurgical test work at the SGS Lakefield, Ontario Laboratory. SGS Canac conforms to the requirements of ISO/IEC 17025 and is accredited by the Standards Council of Canada for the specific undertaken. Gary O'Connor, FAusIMM is a qualified person under NI 43-101 and has reviewed and approved the context press release.

## **About Moneta**

The Company holds a 100% interest in 6 core gold projects strategically located along the Destor-Porcupine Fault Zone Timmins Gold Camp with over 85 million ounces of past gold production. The projects consist of the Golden Highway, Not Tisdale, Nighthawk Lake, DeSantis East, Kayorum and Denton projects. The Golden Highway Project covers 12 kilometer prospective ground along the DPFZ of which 4 km hosts the current 43-101 mineral resource estimate comprised of an resource of 556,500 ounces gold contained within 3.82 Mt @ 4.53 g/t Au and a total of 1,174,000 ounces gold contained 8.47 Mt @ 4.31 g/t Au in the inferred category at a 3.00 g/t Au cut-off.

The Company's public documents may be accessed at www.sedar.com. For further information on the Company, pleas website at www.monetaporcupine.com or email us at info@monetaporcupine.com.
