New High Priority Drill Targets Identified at Tokop Gold Project from Property-Wide Geophysical Program

23.03.2022 | GlobeNewswire

VANCOUVER, March 23, 2022 - <u>Riley Gold Corp.</u> (TSX.V: RLYG) (OTCQB: RLYGF) ("Riley Gold" or the "Company") is pleased to announce newly identified high priority geophysical targets resulting from its ongoing exploration programs at its Tokop Gold Project ("Tokop"), located in Esmeralda County, Nevada. Tokop's land package includes more than 21 Square Kilometres ("sq km") within Nevada's prolific Walker Lane Trend.

As a result of Riley Gold's cumulative exploration efforts to date, Tokop is now being interpreted to have two styles of mineralization within the project land package. Reference is being made to Tokop North and Tokop South within the global Tokop project as the mineralizing systems tend to dominate by area: the reduced intrusive-related gold ("RIRG")/Orogenic system is better seen in the Tokop North area while the low sulfidation, epithermal system (akin to the Bullfrog Mine) is more prevalent in exposures in Tokop South. This release will focus on geophysics results from Tokop North with additional results from the Tokop South area forthcoming.

"The goal of utilizing geophysics, along with other exploration tools such as rock sampling, soil sampling, and structural mapping is to layer additional information in order to target and identify the best drill hole locations for success. We have only been working on Tokop for a little over a year and have made considerable progress in understanding previous work and augmenting that information with our own exploration in preparing a geological model for discovery of a gold deposit. This includes the epithermal mineralization in the southern portion of the project (Tokop South) which was recently identified as a secondary style of mineralization and augments the intrusive related main Tokop area (Tokop North). Our collective work completed last year has culminated into several high priority drill targets that we are excited about and are advancing towards being drill ready," stated Todd Hilditch, CEO of Riley Gold Corp.

Geophysics

Ground magnetics and gravity surveys were conducted by Magee Geophysical of Reno, Nevada, during the fall of 2021 at Tokop. Raw data was provided to Jim Wright of Wright Geophysical in Spring Creek, Nevada, for interpretation and assistance in targeting future drilling. Preliminary interpretation suggests several targets that coincide with recent mapping and surface sampling. The data are simultaneously being added to ongoing modeling that includes drilling, surface mapping, as well as rock and soil sample data.

Magnetic lines were run NE - SW every 200 metres ("m"). Several anomalies of interest have confirmed previously identified prospects which are now at the drill-ready stage of exploration. These anomalies primarily represent alteration via magnetite destruction as well as potential carbonate skarn targets in Precambrian carbonate units (Wyman Formation and Reed Dolomite). Additionally, the survey indicates a deeper intermediate intrusive potentially related to the RIRG mineralizing event.

The gravity survey was conducted on a 200-m grid. Gravity data revealed the potential for very prospective drill targets that appear relatively shallow in the newly defined target areas. For example, drill targets are indicated near strong gravity gradients and relatively large areas of low density, possibly altered rocks. Gravity has also aided in understanding depth to bedrock under pediment cover in areas which mineralization is predominantly concealed.

The current interpretation of the ground magnetic dataset comes after an initial round of prospect-scale and regional-scale mapping at Tokop. The Riley Gold team has found that subdued magnetic highs are primarily associated with granitoids of the Sylvania Pluton but are also associated with the shaley-carbonate Wyman

Formation.

Figure 1 - Tokop North Ground Magnetics Survey overlain by Rock/Soil Samples and Structural Interpretation

Prospect-scale mapping observations include intermediate dike swarms often associated with magnetic highs; while small intermediate dikes at the surface are not large enough to visualize at the survey's resolution, these mapped dikes are thought to overlie a larger intermediate intrusive at depth.

It is clear from ground magnetic data that the same structural fabric observed at Tokop extends beyond the Main area (within Tokop North) which was drilled in 2021 by Riley Gold. Surface rock sampling, trends in the locations of historic adits and shafts, and subsequent drilling indicate that mineralized faults at Main strike northwest; this same northwest trend in mineralization is noted in the Cabin area to the southwest of Main. Additionally, faults which strike north-south are also confirmed to host mineralization based on mapping and sampling. These northwest and north-south faults have been truncated by northeast-trending faults which are thought to be post-mineralization. Initial structural interpretation on the Tokop property has been further confirmed with ground magnetic geophysics based on the trends of magnetic highs.

Geologic Overview

Recent work at Tokop has revealed more than one style of gold mineralization and host rock. One is a RIRG system hosted in granitoids and carbonate units, while the other a system is typical Walker Lane-style epithermal mineralization hosted in Tertiary volcanics (Ammonia Tanks tuff) as well as Wyman Formation carbonate. This style of mineralization is more akin to ore deposits approximately 30 miles south and east of the project like those of the Bullfrog District. Deposits of the Bullfrog District (surrounding Beatty, Nevada) are low-sulfidation, volcanic and sedimentary-hosted, epithermal gold deposits like the Bullfrog Mine operated by Barrick Gold which produced over 2.3 million ounces of gold and 3.0 million ounces of silver from 1989 - 1999ⁱ, from open pit and underground workings. Additional exploration and deposit development in the Bullfrog District includes work by Corvus Gold (now AngloGold), Coeur Mining, Kinross, and <u>Augusta Gold Corp.</u>

The RIRG model is similar to large mines in the Tintina Gold Belt of central Alaska and contiguous parts of the Yukon. The best known and most economically important of these include Fort Knox (>8.0 M oz gold produced through 2020 with an additional 2.47 M oz P+P Reserveⁱⁱ), Pogo gold mine (4.0 M oz gold produced through 31 March 2021 with additional 3.956 M oz M & I resource and 1.740 M oz Inferred Resourceⁱⁱⁱ) and the Eagle Mine of the Dublin Gulch Properties in the Yukon (M & I resource of ~2.98 M oz gold^{iv}). At Tokop, similar to those mines, sheeted quartz veins in a multi-phase, reduced, calc-alkaline granitoid intrusive as well as surrounding metamorphosed sedimentary rocks, coupled with widespread hydrothermal alteration, may host gold mineralization of significant potential. Shear-hosted veins extend for nearly two kilometres along strike at Tokop. To date, sampling of these vein systems returned grades of up to 71.73 gpt gold and 970 gpt silver (historical and current sampling). This year's drilling has confirmed high grade mineralization down dip from surface rock chip sampling in the first three holes released, with grades up to 17.1 gpt gold and 235 gpt silver.

About Riley Gold Corp.

Riley Gold is an exploration and development company focused in Nevada, USA. The Company's primary focus is on its two cornerstone assets: the Tokop Gold Project located within the Walker Lane Trend and the Pipeline West/Clipper Project located in the Battle Mountain Eureka Trend. Riley Gold's founders and leadership team have a proven track record of maximizing shareholder value during each phase of the mining life cycle: exploration, development, and production.

Qualified Person

This news release has been reviewed and approved by Charles Sulfrian, CPG., Exploration Manager, of Riley Gold and a 'qualified person', as defined by National Instrument 43-101, Standards of Disclosure for Mineral Projects. The Qualified Person has not completed sufficient work to verify the historic information on Tokop, particularly in regards to the historical drill and chip sample results. However, the Qualified Person believes that drilling and analytical results were completed to industry standard practices. The information provides an indication of the exploration potential of Tokop but may not be representative of expected results.

Cautionary statement regarding forward-looking information

Certain disclosures in this release constitute "forward-looking information" within the meaning of Canadian securities legislation (such statements being referred to as "forward-looking statements"). Forward-looking statements are statements that are not historical facts and are generally, but not always, identified by words such as the following: expects, plans, anticipates, believes, intends, estimates, projects, assumes, potential and similar expressions. Forward-looking statements involve risks, uncertainties and other factors that could cause actual results, performance, prospects and opportunities to differ materially from those expressed or implied by such forward-looking statements, including statements regarding the exploration program at Tokop, including results of drilling, sampling, geophysics, interpretations and future exploration plans at Tokop. Factors that could cause actual results to differ materially from these forward-looking statements include, but are not limited to, variations in the nature, quality and quantity of any mineral deposits that may be located, the Company's inability to obtain any necessary permits, consents or authorizations required for its planned activities, and the Company's inability to raise the necessary capital or to be fully able to implement its business strategies. The reader is referred to the Company's public disclosure record which is available on SEDAR (www.sedar.com). Although the Company believes that the assumptions and factors used in preparing the forward-looking statements are reasonable, undue reliance should not be placed on these statements, which only apply as of the date of this news release, and no assurance can be given that such events will occur in the disclosed time frames or at all. Except as required by securities laws and the policies of the TSX Venture Exchange, the Company disclaims any intention or obligation to update or revise any forward-looking statement, whether as a result of new information, future events or otherwise.
