

# Riley Gold Announces New Epithermal Exploration Targets at Tokop South

04.04.2022 | [GlobeNewswire](#)

VANCOUVER, April 04, 2022 - [Riley Gold Corp.](#) (TSX.V: RLYG) (OTCQB: RLYGF) ("Riley Gold" or the "Company") is pleased to announce the discovery of new targets that exhibit intense epithermal alteration, stockwork, and veins (Image 1) at surface that along with geophysical signatures suggests hydrothermally altered zones and target horizons at relatively shallow depths. These new prospective areas of low sulfidation epithermal mineralization are in the southern portion ("Tokop South") of its Tokop Gold Project ("Tokop"), located in Esmeralda County, Nevada.

On March 28, 2022, Riley Gold announced a significant increase to its Tokop land package (at Tokop South) which now consists of more than 31 square kilometres within Nevada's prolific Walker Lane Trend. The claims were staked based on the interpretation and results of the exploration activity conducted at Tokop South.

According to Hillary Jochens, Tokop Project Manager, "Initial mapping plus soil and rock sample data, as well as hyperspectral alteration and geophysical data analyses combine to highlight several high-priority targets within the newly acquired ground. This represents an exciting opportunity for further exploration. At the Ghost prospect, the occurrence of several parallel sets of northerly trending epithermal veins and structures is analogous to stockwork zones with 0.5 - 1 gram per tonne gold in the Bullfrog Mine District. This area could represent very prospective drill targets for higher grade gold at depth." (Ms. Jochens is the former Exploration Manager for Augusta Gold at their Bullfrog Mine Project at Beatty, Nevada.)

## Geophysical Surveys and Vein Mineralization at Tokop South

The three prospect areas (Ghost, Diamondback, and Desert Bloom) within Tokop South exhibit locally intense epithermal alteration, stockwork, and veins at surface. This, combined with geophysical signatures suggests hydrothermally altered zones and target horizons at relatively shallow depths. Rock sampling has yielded assays of more than 1.3 gram per tonne ("gpt") gold. Soil sampling has revealed anomalous gold and epithermal pathfinder trends. Portions of this area host several old prospects, shafts, and adits. The collective, multi-layered data defined these new targets and provided the basis for increasing the land package size at Tokop South.

Gravity and ground magnetic susceptibility surveys played an important role in Riley Gold expanding its claim block at Tokop South. Figure 2, Figure 3 and Figure 4 illustrate some of the gravity and magnetic data for the area. Gravity generally indicates (by the warm colors) that large areas of potential host rocks p&#1028; Wyman Formation carbonate rocks underlie a thin veneer of pediment. One sample collected from a prospect pit in the Wyman yielded 1.34 gpt gold and 47.2 gpt silver (See Figure 2,3, and 4). Otherwise, cool colors can indicate areas of lower-density rocks, including alluvium, or at Tokop South, often volcanics of the Ammonia Tanks Tuff. Many of the epithermal veins occur in the tuffs, in similar style to those at the Bullfrog Mine. One sample cut from chalcedonic to opaline vein material ran 1.08 gpt gold and 8.97 gpt silver; another yielded 1.02 gpt gold and 8.32 gpt silver from another epithermal vein nearly 1 kilometre away. These grades are analogous to those found at the Bullfrog and Montgomery-Shoshone mines in chalcedonic-opaline stockwork zones<sup>i</sup>.

Image 1 shows typical high-level opaline chalcedony veins seen mostly at Tokop South (Ghost prospect) but elsewhere, too, at Tokop. The veins represent silica-rich fluids moving up structures and fractures along faults and other contacts. They are often devoid of gold and other pathfinder elements. These veins usually occur above boiling zones where gold may have been deposited. The depth to potential gold mineralization can vary from a few meters ("m") to 200 m or more. Reverse circulation drilling at Tokop South (Ghost prospect) was detailed in an internal report for High Frontier Resources<sup>ii</sup> in 1990. One hole near such a vein encountered 12.2 m of 0.96 gpt gold from surface (Figure 2).

In Figure 2, the red circle denotes a complex zone of intersecting structures and locally intense alteration. This is also the area where rotary reverse circulation drilling from 1990 intersected 12.2 m of 0.96 gpt gold from 0 - 12.2 m, including 6.1 m of 1.6 gpt gold in a structurally complex area at a faulted contact between Wyman carbonates and Miocene Ammonia Tanks Tuff. The abundance of parallel northerly trending structures appears to be significant and is very encouraging for future exploration in the area. Several geochemical trends in soils suggest evidence of additional northerly trending veins under thin alluvial cover.

*Figure 3: Gravity - first vertical derivative.*

<https://www.globenewswire.com/NewsRoom/AttachmentNg/54e656a9-88f6-4397-9309-12a278110764>

Figure 3 relates to the rate of change in elevation of units of differing density and is often used to help interpret structure. Figure 3 strongly supports the structural interpretation.

*Figure 4: Ground Magnetics -Reduced to Pole, Residual*

<https://www.globenewswire.com/NewsRoom/AttachmentNg/b96424b3-0262-48e4-87ed-3987a1a88b32>

Subdued magnetic response (cool colors) in the above Figure 4, Reduced to Pole (RTP) Total Magnetic Intensity (TMI) underscores the fact that the felsic intrusives of the Sylvania Stock, here Jurassic-Cretaceous quartz monzonite, (JKqm) are reduced, along the southwestern side of the new claim block. Other areas near the Tokop South (Diamondback prospect) area show higher magnetic response (warm colors), suggesting a buried intermediate intrusive. Such intermediate intrusives may play a key role in providing the heat and possibly mineralizing fluids to the system. However, this hypothesis is not yet supported by accurate age dating and more detailed geochemical and petrographic analyses.

A program of detailed mapping and additional soil and rock sampling is planned to begin later this spring, leading to the development of high-quality drill targets.

About Riley Gold Corp.

Riley Gold is an exploration and development company focused in Nevada, USA. The Company's primary focus is on its two cornerstone assets: the Tokop Gold Project located within the Walker Lane Trend and the Pipeline West/Clipper Project located in the Battle Mountain Eureka Trend. Riley Gold's founders and leadership team have a proven track record of maximizing shareholder value during each phase of the mining life cycle: exploration, development, and production.

Qualified Person

This news release has been reviewed and approved by Charles Sulfrian, CPG., Exploration Manager, of Riley Gold and a 'qualified person', as defined by National Instrument 43-101, Standards of Disclosure for Mineral Projects. The Qualified Person has not completed sufficient work to verify the historic information on Tokop, particularly in regards to the historical drill and chip sample results. However, the Qualified Person believes that drilling and analytical results were completed to industry standard practices. The information

provides an indication of the exploration potential of Tokop but may not be representative of expected results.

*Cautionary statement regarding forward-looking information*

*Certain disclosures in this release constitute "forward-looking information" within the meaning of Canadian securities legislation (such statements being referred to as "forward-looking statements"). Forward-looking statements are statements that are not historical facts and are generally, but not always, identified by words such as the following: expects, plans, anticipates, believes, intends, estimates, projects, assumes, potential and similar expressions. Forward-looking statements involve risks, uncertainties and other factors that could cause actual results, performance, prospects and opportunities to differ materially from those expressed or implied by such forward-looking statements, including statements regarding the exploration program at Tokop, including results of drilling, sampling, geophysics, interpretations and future exploration plans at Tokop. Factors that could cause actual results to differ materially from these forward-looking statements include, but are not limited to, variations in the nature, quality and quantity of any mineral deposits that may be located, the Company's inability to obtain any necessary permits, consents or authorizations required for its planned activities, and the Company's inability to raise the necessary capital or to be fully able to implement its business strategies. The reader is referred to the Company's public disclosure record which is available on SEDAR ([www.sedar.com](http://www.sedar.com)). Although the Company believes that the assumptions and factors used in preparing the forward-looking statements are reasonable, undue reliance should not be placed on these statements, which only apply as of the date of this news release, and no assurance can be given that such events will occur in the disclosed time frames or at all. Except as required by securities laws and the policies of the TSX Venture Exchange, the Company disclaims any intention or obligation to update or revise any forward-looking statement, whether as a result of new information, future events or otherwise.*
