

Thunder Gold Announces Phase One Drill Results and Start of Phase Two Drill Program at the Tower Mountain Gold Property

17.05.2025 | [Newsfile](#)

Thunder Bay, May 17, 2025 - [Thunder Gold Corp.](#) (TSXV: TGOL) (FSE: Z25) (OTCQB: TGOLF) (formerly White Metal Resources Corp) ("Thunder Gold" or the "Company") is pleased to announce results from the Phase One drill program at its 100%-owned, 2,500-hectare, Tower Mountain Gold Property, located in the Shebandowan Greenstone Belt, 50 kilometres west of the port city of Thunder Bay, Ontario.

Highlights:

- Results suggest the high-grade gold target plunges 30° to 40° to the southeast.
- Nine holes (1,209 metres) of the planned 2,000-metre program were completed, 800 metres were deferred to a fully funded Phase Two program commencing in June.
- Statistical analysis confirms similar grade and distribution to the historical data parallel to the western contact of the "Mountain Intrusive Complex ("TMIC").
- All mineralization to date at the P-Target is hosted by intrusive rocks comprising the TMIC which is largely untested within its 2.5 x 1.5-kilometre footprint.

The Phase One drill program (2,000 metres) was designed to test the P-Target down-dip, along a 300-metre strike length. Only 1,200 metres (60%) of the Phase One drill program was completed. Three (3) holes (800 metres) were deferred to the Phase Two drill program due to safety concerns related to access, construction and operations at the drill pads proposed on Section 400 (Reference Figure 1). The combination of steep topographic relief and significant snow accumulation led to the decision to defer the planned drilling on Section 400 to the Phase Two drill program scheduled to begin this month.

Eight (8) of nine (9) holes completed in Phase One intersected low-grade gold values, ranging from 0.10 to 0.50 g/t Au over broad intervals, often several tens of metres (Reference Table 1.0 & Figure 2). One-hole TM25-166 terminated prematurely in a flat-lying fault zone at a depth of 84.0 metres. None of the Phase One drill holes intersected the intensely brecciated and altered monzonite host rock that returned substantially elevated gold grades in the 2024 surface channel sampling that averaged 3.96 g/t Au over 23.7 metres and subsequent near-surface drill holes that averaged 1.11 g/t Au over 23.7 metres true thickness.

This initial drilling suggests the host monzonite plunges to the southeast at 30° to 40° (Reference Figure 2). The Phase One drill program was designed to test the eastern and western strike extent, the down-dip continuity to the south and the plunge continuity to the southeast (Reference Figures 1 & 2). Holes TM25-161, 162 and 163 (SECTIONS 200 & 300), intersected syenite, supporting the interpretation of a southeast plunge to the target monzonite. Planned drill collar locations on SECTION 300 had to be shifted south due to steep topographic relief. When field personnel advised that access to SECTION 400 wasn't possible, holes 165 and 166 (SECTION 300) were fanned to the east, off the TM25-162 drill pad in an effort to intersect the target monzonite down plunge. Unfortunately, the geometry (dip, plunge, collar location and hole alignment) wasn't optimal and these holes missed the target, interpreted as passing under target. The decision was then made to test the strike extent of the monzonite to the west on Section 100 with holes TM25-167, 168 and 169, all of which intersected syenite as predicted.

Wes Hanson, President and CEO notes, "I'm very pleased with the results from the P-Target to date. Statistically, the drill results, excluding the high-grade surface channel samples, are almost an exact match to the larger, historical data set from the western contact of the Tower Mountain Intrusive Complex ("TMIC"). Key correlations observed include both average grade and gold distribution at all relevant cut-off grades.

Demonstrating that a similar statistical population falls along the eastern TMIC contact is a critical step in demonstrating the resource potential of the Tower Mountain Property and confirms our primary exploration concept that the TMIC perimeter offers excellent potential to increase the mineralization footprint."

"I'm also pleased to report our all-in exploration costs for Phase One was C\$273 per metre, well below our guidance of C\$300 per metre. This positions Tower Mountain as one of the lowest cost exploration opportunities in Canada."

"We plan to resume drilling in early June as planned, completing the deferred holes at the P-Target before moving on to the 37-38 and A Targets along the western TMIC margin where historical drilling failed to close off both targets. Both targets are near-surface and both have returned high grade results including 963.0 g/t over 1.5 metres in TM23-137, and 4.05 g/t over 21.0 metres in hole TM22-119 at the A-Target."

FIGURE 1. P-TARGET SOIL GEOCHEMISTRY WITH 2024 & 2025 PHASE ONE DRILL RESULTS

The P-Target is an intensely silicified and carbonatized monzonite, discovered in September 2024. Drilling in November 2024 established that the mineralized host rocks extend for over 100 metres along a northwest to southeast strike (Reference Figure 3). The altered monzonite sub-crops at surface and persists for 30 metres down-dip. The true width of the mineralized monzonite ranges from 25 metres (northwestern limit of drilling) to over 40 metres at the southeastern limit of drilling, suggesting potential thickening to the southeast down plunge. The monzonite strikes northwest - southeast, plunges southeast at 30° to 40° and dips 50° to 55° to the southwest. A strong, multi-sample soil geochemical anomaly lies 500 metres to the southeast of the last drilled section (SECTION 300). This gold-in-soil anomaly is coincident with the interpreted TMIC contact within a strong magnetic low, another vector for gold mineralization. All gold mineralization observed at Tower Mountain correlates to intervals of intense to strong magnetic destruction.

FIGURE 3. PHASE TWO DRILL PLAN

To view an enhanced version of this graphic, please visit:

https://images.newsfilecorp.com/files/5364/252534_ac97cfd894fad9a2_003full.jpg

Phase Two drilling (1,800 metres) shall commence at the P-Target, SECTION 400 and transition to the 37-38 Target Reference Figure 3). The 37-38 Target is currently defined by two drill holes, spaced 100 metres apart. TM23-137 intersected 963.0 g/t over 1.5 metres (125.0 to 127.0 metres), the highest grade ever reported at Tower Mountain. The high-grade result is bounded by 0.79 g/t Au over 21 metres (104.5 to 125.5 metres) and 0.61 g/t Au over 19.9 metres (127.0 to 146.9 metres). Other significant intervals include 0.95 g/t Au over 17.0 metres (187.5 to 204.5 metres), 0.89 g/t Au over 10.2 metres (249.5 to 259.7 metres), 0.65 g/t Au over 22.5 metres (275.0 to 297.5 metres) and 2.49 g/t Au over 9.0 metres (349.5 to 358.5 metres).

TM23-138, drilled 100 metres to the north, intersected 1.18 g/t Au over 19.0 metres (41.5 to 60.5 metres), 0.45 g/t Au over 16.0 metres (83.0 to 99.0 metres), 0.63 g/t Au over 38 metres (99.0 to 137.0 metres), 1.67 g/t Au over 8.0 metres (137.0 to 145.0 metres) and 1.86 g/t Au over 10.4 metres (151.6 to 162.0 metres) (Reference Figure 3).

The proposed drilling at the 37-38 Target offers the opportunity to rapidly establish a large, mineralized target. The objective for the 37-38 Target drilling is to demonstrate continuity of mineralization over a 200-metre x 200-metre x 100-metre volume of rock at an average grade of 0.75 to 1.25 g/t Au.

Further to the south, the A-Zone (Reference Figure 3) was traced by drilling in 2021 for 100 metres to a maximum depth of 35 metres from surface. Grades from surface sampling and drilling ranged from 2.0 to 4.0 g/t Au across an interpreted true width of approximately 20.0 metres. The A-Zone strikes northwest and dips sub-horizontally to the southeast. Neither the strike nor down-dip continuity is closed off by drilling. The proposed Phase Two drilling at the A-Zone is designed to test for continuity of this high-grade zone along an interpreted plunge of 10° to 20° to the southeast.

Quality Assurance and Quality Control

Diamond drilling utilizes NQ diameter tooling. The core is received at the on-site logging facility where it is, photographed, logged for geotechnical, physical properties and geological data. Samples are identified, recorded, and cut in half by wet diamond saw. Half the core is sent for assay at an accredited laboratory with the remaining half core stored on site. A standard sample length of 1.5 meters is employed, varying only at major lithological contacts. Certified standards and blanks are randomly inserted into the sample stream and constitute approximately 5-10% of the sample stream. Certified standards and blank performance is monitored with any failures evaluated and investigated to determine if said failure is a result of error during submission. Any unexplained failures are identified and the five samples preceding and following the failure are re-assayed. In addition, standards and blanks are inserted into the re-assayed interval stream to monitor analytical performance. Samples are shipped to the Activation Laboratories Ltd. facility in Thunder Bay, Ontario, where sample preparation and analyses are completed. All samples are analyzed for gold using a 30-gram lead collection fire assay fusion (FA) with an atomic absorption (AAS) finish. All assay results greater than 5.0 g/t Au are re-assayed using a gravimetric analysis.

Qualified Person

Technical information in this news release has been reviewed and approved by Wes Hanson, P.Geo., President and CEO of Thunder Gold Corp., who is a Qualified Person under the definitions established by National Instrument 43-101.

About the Tower Mountain Gold Property

The 100%-owned Tower Mountain Gold Property is located adjacent to the Trans-Canada highway, approximately 50-km west of the international port city of Thunder Bay, Ontario. The 2,500-hectare property surrounds the largest, exposed, intrusive complex in the eastern Shebandowan Greenstone Belt where most known gold occurrences have been described as occurring either within, or proximal to, intrusive rocks. Gold at Tower Mountain is localized within extremely altered rocks parallel to the western contact of the intrusive centre. Drilling has established anomalous gold extending out from the intrusive contact for over 500 metres along a 1,500-metre strike length, to depths of over 500 metres from surface. The remaining 75% of the perimeter surrounding the intrusion shows identical geology, alteration, and geophysical response, offering a compelling exploration opportunity.

About Thunder Gold Corp.

Thunder Gold Corporation, is a junior exploration company focused on gold discovery in Canada. For more information about the Company please visit: www.thundergoldcorp.com.

TERM IS DEFINED IN THE POLICIES OF THE TSX VENTURE EXCHANGE) ACCEPTS RESPONSIBILITY FOR THE ADEQUACY OR ACCURACY OF THIS RELEASE.

The information contained herein contains "forward-looking information" and "forward-looking statements" within the meaning of applicable securities legislation (collectively, "forward-looking statements"). Forward-looking statements relate to information that is based on assumptions of management, forecasts of future results, and estimates of amounts not yet determinable. All statements, other than statements of historical fact, are forward-looking statements and are based on predictions, expectations, beliefs, plans, projections, objectives and assumptions made as of the date of this news release, including without limitation; anticipated results of geophysical drilling programs, geological interpretations and potential mineral recovery. Any statement that involves discussions with respect to predictions, expectations, beliefs, plans, projections, objectives, assumptions, future events or performance (often but not always using phrases such as "expects", or "does not expect", "is expected", "anticipates" or "does not anticipate", "plans", "budget", "scheduled", "forecasts", "estimates", "believes" or "intends" or variations of such words and phrases or stating that certain actions, events or results "may" or "could", "would", "might" or "will" be taken to occur or be achieved) are not statements of historical fact and may be forward-looking statements.

Forward-looking statements are subject to a variety of risks and uncertainties which could cause actual events or results to differ from those reflected in the forward-looking statements, including, without limitation: risks related to failure to obtain adequate financing on a timely basis and on acceptable terms; risks related to the outcome of legal proceedings; political and regulatory risks associated with mining and exploration; risks related to the maintenance of stock exchange listings; risks related to environmental regulation and liability; the potential for delays in exploration or development activities or the completion of feasibility studies; the uncertainty of profitability; risks and uncertainties relating to the interpretation of drill results, the geology, grade and continuity of mineral deposits; risks related to the inherent uncertainty of production and cost estimates and the potential for unexpected costs and expenses; results of prefeasibility and feasibility studies, and the possibility that future exploration, development or mining results will not be consistent with the Company's expectations; risks related to the gold price and other commodity price fluctuations; and other risks and uncertainties related to the Company's prospects, properties and business detailed elsewhere in the Company's disclosure record. Should one or more of these risks and uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary materially from those described in forward-looking statements. Investors are cautioned against attributing undue certainty or reliance on forward-looking statements. These forward-looking statements are made as of the date hereof and the Company does not assume any obligation to update or revise any forward-looking statements, other than as required by applicable law, to reflect new information, events or circumstances, or changes in management's estimates, projections or opinions. Actual events or results could differ materially from those anticipated in the forward-looking statements or from the Company's expectations or projections.
