

Tarsis Provides Exploration Results for the Rogue Prospect and Newly Staked Plata East Prospect, Yukon

28.11.2011 | [Marketwired](#)

VANCOUVER, BRITISH COLUMBIA -- (Marketwire - Nov. 28, 2011) - [Tarsis Resources Ltd.](#) (TSX VENTURE: TCC) ("Tarsis" or "the Company") is pleased to provide details of its 2011 exploration on the Rogue and recently acquired Plata East prospects, east central Yukon.

The Company conducted reconnaissance-style exploration that comprised stream sediment and soil geochemical sampling, prospecting and cursory geological mapping on its Rogue prospect and a number of grass-roots targets identified nearby. The targets described represent sediment-hosted silver and/or gold prospects within the Selwyn Basin.

Rogue Prospect

The Rogue prospect is underlain by the Selwyn Basin stratigraphy where highly anomalous silver-in-soil values were reported from historic geochemical sampling. Stream sediment sampling conducted by Tarsis yielded values ranging from 0.1 g/t to 4.3 g/t silver. The stream sediment samples also returned anomalous results for pathfinder elements arsenic (12 ppm to 251 ppm), mercury (0.1 to 1.7 ppm), antimony (0.5 to 148.5 ppm), thallium (0.16 to 1.28 ppm) and zinc (94 to 5,340 ppm).

Soil sampling carried out at one location included the collection of 18 soil samples (across a slope, spaced 25 meters apart) that returned values ranging from 2.7 g/t to 15.9 g/t silver, averaging 7.9 g/t. Mercury values were also strongly elevated (0.1 ppm to 17.1 ppm) while gold values ranged from below detection to 41 ppb.

Cursory prospecting did not identify the source of the anomalous silver values, however, given the tenor of the soil and stream sediment response for silver, the Company believes further exploration is warranted.

Plata East Prospect

The Plata East target is located approximately seven kilometers east of the Plata airstrip and 20 kilometers east of the Rogue prospect. The Plata East target was identified through analysis of government geochemical sampling which yielded anomalous thallium in stream sediment response of 1.17 ppm within stratigraphy considered prospective for sediment-hosted gold mineralization. The Company staked 72 claims to cover the anomalous results.

The claim block is underlain by Mississippian to Permian interbedded calcareous siltstones, shales, cherts and minor dolostones and limestones deposited in a shelf environment unconformably above stratigraphy of the Selwyn Basin. Stratigraphy has been subjected to local thrusting and subsequent brittle faulting believed to be associated with mineralization identified on the property and a nearby minfile occurrence.

Sixty-one rock samples representing a number alteration styles were collected during prospecting traverses and assay results returned values ranging from below detection to 0.74 g/t gold. The sample of gossanous float returning elevated gold response also yielded 7.43 g/t silver, 354 ppm arsenic and 2.08 ppm mercury.

The technical information contained in this press release was prepared under the supervision of Mr. Marc G. Blythe, P.Eng., the President and CEO of Tarsis Resources Ltd. Mr. Blythe is a Qualified Person as defined by NI 43-101.

About Tarsis Resources

[Tarsis](#) is an exploration company following the prospect generator business model, with mineral properties in Yukon, Canada and Mexico. The Company acquires projects on attractive terms, adds value and then vends or options out projects to partners for advancement.

On behalf of the Board,

Marc G. Blythe, P.Eng., MBA.
President and Chief Executive Officer
