

# Waymar Reports Results From Detailed Soil Sampling Around Anza and Identifies New Exploration Targets

05.09.2012 | [Marketwired](#)

VANCOUVER, 09/05/12 - [Waymar Resources Ltd.](#) ("Waymar" or the "Company") (TSX VENTURE: WYM) is pleased to report the results from its Phase 2 detailed soil sampling campaign around the discovery at Anza.

The survey revealed significant gold anomalous zones beyond the area covered by the Company's current drilling program. This news release should be read in conjunction with the map captioned as "Au Contours in Soils - Detailed Geochemistry Survey (Phases 1 + 2)" available on the Company's website at the link: [www.waymarresources.com/projects/maps/](http://www.waymarresources.com/projects/maps/), showing the assay values reported in contour format.

The Jesuitas, Guaimarala and Charrascala anomalies are similar in strength or better than the area around the Anza deposit drilled so far.

The Jesuitas and Guaimarala anomalies are interpreted as strong indications of mineralization on strike extensions of the Aragon fault.

Charrascala is a roughly north-south zone parallel to, and 1.5 km west of, the Anza deposit. Charrascala corresponds to areas where mineralization, including veins, breccias and an artisanal copper mine hosted by a diorite, have been identified at surface.

"These are very encouraging results. They reinforce our intention to continue drilling the extensions of the Anza deposit along the Aragon fault. They also indicate that within the immediate vicinity of Anza there is good potential for fresh new discoveries," said Pablo Marcet, President of Waymar.

The Phase 2 sampling consisted of 1,405 soil samples taken every 50 m on lines oriented east-west and separated by 100 m. The samples were taken from the "C" soil horizon with the aid of manual Auger drills. This sampling campaign is an extension of the original orientation survey, which consisted of 789 soil samples taken with identical spacings and protocols, and which guided the first drilling on the property in early 2011.

An industry standard Quality Control and Quality Assurance program, which includes Standard Reference Materials, blanks and duplicates, was established and followed during the sampling program. Samples were assayed for gold by a 30 gram fire assay with an AAS finish, and 35 element geochemical analyses completed using an aqua regia digestion with an ICP-AES finish. All soil and rock samples were prepared in Medellin, Colombia, and assayed in Lima, Peru, by ALS Group Laboratories which are ISO 9001:2008 certified laboratories.

David Makepeace, M.Eng., P.Eng., senior geologist for Micon International Limited is the qualified person as defined by National Instrument 43-101. He has reviewed and verified the technical disclosure contained herein and accepts responsibility for such disclosure.

Any potential quantity and grades are conceptual in nature. There has been insufficient exploration to define a mineral resource at the Anza property to date, and it is uncertain if further exploration will result in targets being delineated as a mineral resource.

## About Waymar Resources Ltd.

[Waymar Resources Ltd.](#) is a Canadian mineral exploration company with an option to acquire 100% interest in the Anza project located in the west of the Antioquia Department in the Republic of Colombia. Upon exercise of the option, the optionors will retain a 2% net smelter return royalty on that portion of the Anza property governed by the Option Agreement, one-half of which may be purchased by Waymar for a cash payment of US\$1,000,000. Waymar also has 100% ownership of certain properties surrounding Anza that cover the district's mineral potential and is continually seeking opportunities to acquire exploration properties. Colombia is a significant producer of gold, nickel, emeralds, petroleum and natural gas as well as a leading producer of coal in Latin America.
