

# Integra Gold Expands South Triangle Zone, Intersects 13.14 g/t Gold Over 2.0 Meters

23.01.2014 | [Marketwired](#)

## Press Release Highlights:

- **Discovery of eastern extension of the South Triangle zone**
- **South Triangle zone remains open to the east and up-dip towards Triangle zone**

VANCOUVER, BRITISH COLUMBIA--(Marketwired - Jan 23, 2014) - [Integra Gold Corp. \(TSX VENTURE:ICG\)](#) ("Integra" or the "Company") is pleased to announce final results of its 2013 fall drill program on the South Triangle zone at its Lamaque Gold Project located in Val-d'Or, Québec. The Company completed 6,966 m in 13 drill holes on this target in 2013. Results disclosed today confirm the eastern extension of the South Triangle zone. The discovery of gold mineralization to the South and South-East of the existing Triangle Zone provide significant potential for resource expansion at Triangle.

"The Triangle Zone contains the highest grade indicated resource on the Lamaque Project, so to be intersecting mineralized veins hundreds of meters from the current resource limit is very encouraging. Drilling will now test the area in between the Triangle and South Triangle Zones to determine if mineralization is continuous throughout," commented Company President and CEO Stephen de Jong. "The 20,000 meter Triangle drill program announced last week is focused on defining resources above the 400 meter vertical level in order to advance the project, but as drilling has intersected high grade mineralized veins as deep as 1,200 meters, there remains substantial potential to expand known resources at depth."

### South Triangle Drilling Program

South Triangle results disclosed today have re-confirmed the presence of gold mineralized shear hosted veins in volcanic rocks south of the Triangle zone, returning, among others, an intercept of 13.14 g/t Au over 2.0 m in hole TMS-13-09. This new intercept is the eastern extension, some 60 m to the east, of the mineralized zone previously disclosed in hole TMS-13-07 which graded 13.29 g/t Au over 7.0 m (see press release dated November 18, 2013). As intercepts from hole TMS-13-07 and TMS-13-09 are also 175 m down-dip from the closest Triangle Zone intersections, there is potential to build upon the current resource base.

Other holes reported today (TMS-13-08 and TMS-13-10 to TMS-13-13) were testing the down dip extensions (between 50 and 100 m down-dip) of the new zones reported from holes TMS-13-07 and TMS-13-09A. Although all holes intersected shear zones with local quartz-tourmaline veining, no significant values are reported.

Due to accessibility issues, the new South Triangle zones could not be tested up-dip towards the Triangle Zone during the Company's 2013 program. These zones will be tested as part of the 2014 drill program.

## **Project and Company Profile**

Integra's Lamaque Gold Project is located in the heart of the Val-d'Or gold camp in the Province of Québec, Canada, approximately 550 km northwest of Montréal. Québec is rated one of the best mining jurisdictions in the world. Infrastructure, human resources and mining expertise are readily available.

The Company's primary objective is to continue to prove up additional resources while advancing the existing resource towards production. The project is split into two main clusters, the North and the South Clusters, which are located approximately 1 kilometer ("km") from each other. The South Cluster consists of the No. 4 Plug, Triangle and Triangle South zones, and is located 3 km from the City of Val-d'Or. The North Cluster consists of the Parallel, Fortune, No. 5 Plug, and No. 3 Mine zones, and is located 1 km from Val d'Or.

## **Qualified Person**

The Lamaque exploration project is under the direct supervision of Hervé Thiboutot, P.Eng. and Senior Vice-President of the company, a Qualified Person ("QP") as defined by National Instrument 43-101, Alain-Jean Beauregard, P.Geo., and Daniel Gaudreault, P.Eng., Geo. of Géologica Inc., both independent QP as defined by National Instrument 43-101. The Company's QP has reviewed the technical content of this release.

## **Quality Assurance - Quality Control ("QA/QC")**

Thorough QA/QC protocols are followed on the project including insertion of duplicate, blank and standard samples in all drill holes. The core samples are submitted directly to ALS Laboratory Group and Bourlamaque Labs in Val-d'Or for preparation and analysis. Analysis is conducted on 1 assay-ton aliquots. Analysis of Au is performed using fire assay method with atomic absorption finish, with a gravimetric finish completed for samples exceeding 5 g/t Au, or a metallic sieve assay for samples containing visible gold. When available the gravimetric or metallic sieve assay results are used for the reported composite intervals.

## **ON BEHALF OF THE BOARD OF DIRECTORS**
