

# Choice Gold Corp. Intersects More Gold at Sugarloaf Peak Project

05.04.2012 | [Marketwired](#)

VANCOUVER, BRITISH COLUMBIA -- (Marketwire - April 5, 2012) - [Choice Gold Corp.](#) (CNSX:CHF) (MUN:OCG) ("Choice Gold" or "the Company") is pleased to announce the most recent gold results from the phase 1B drilling program at its Sugarloaf Peak Gold Project, located in southwest Arizona. Phase 1B consisted of 13 reverse circulation drill holes, results from the last 7 holes include hole SGR-12-13, the only hole located in the known mineralised area, that intersected a thick sequence of mineralised felsic tuffs returning three mineralised intervals including 10.7 metres at 0.54 g/t Au. The central mineralised zone now extends over 1.1 km along a NE-SW strike between SGR-12-09 and SGR-12-11 and now reveals a width estimated to a minimum of 320 meters within 120 meters of the surface and is open in three directions.

The calculated intervals for drill hole SGR-12-13 are presented in the following table. All intervals were calculated using a 0.15 g/t Au cut-off, a minimal thickness of 25 feet or 7.6 metres and a maximal dilution thickness limited to 3.0 metres.

RC Hole No	From m	To m	Interval* m	Grade g/t Au
SGR-12-13	10.7	24.4	13.7	0.25
	32.0	91.5	59.5	.29
including	51.8	62.5	10.7	0.54
	96	120	24	0.32

\*Intervals represent core length; true thickness is unknown

The hole was collared in strongly argillized tuff units, the alteration is similar to the one observed in hole SGR-12-10, located 325 meters WNW of hole SGR-12-13, that returned 93.0 metres at 0.44 g/t Au (including 21.3 m at 0.53 g/t Au and 33.5 m at 0.51 g/t Au (c.f. press release of March 14, 2012). Hole locations are shown in map on the Choice Gold website ([www.choicegoldcorp.com](http://www.choicegoldcorp.com)).

The other 6 holes SGR-12-14 to SGR-12-19 were not located inside the mineralised area, testing surface rock gold anomalies did not return drill hole intervals of significant thickness however isolated samples returned up to 1.2 g/t gold. The Phase 1B drilling campaign consisted of 13 reverse circulation holes testing the historically known central mineralised area, as well as new areas to the west, south and south-east.

The actual known mineralised area has an estimated surface projection covering 0.33 square kilometres of a much broader surface anomalous zone of 2 square kilometres defined by grab samples returning over 100 ppb gold. Based on the recent results Choice Gold will plan the next phase of drilling with an emphasis on finding the extensions and defining the mineralised central area within the limit of the broad anomalous zone.

All the RC holes were sampled successively from the top to the bottom of each hole following rigorous QAQC procedures. These QAQC procedures include the insertion of blanks, standards, and duplicates. All the samples were shipped to American Assay Lab, Reno, NV, to be pulverised and analysed for Au by the fire assay method and for a suite of trace elements using the ICP method.

Brigitte Dejou, P.Eng., Choice Gold's Manager of Exploration, is the non-independent, Qualified Person, responsible for the technical information reported herein.

## About Choice Gold Corp.

Choice Gold Corp. was created to acquire and advance select, high-potential mineral projects and thereby unlock shareholder value. With this goal in mind, the company has entered an option agreement with Riverside Resources Ltd. (TSX VENTURE:RRI) to acquire a 100% interest in the Sugarloaf Peak Gold Project just west of Quartzsite, Arizona. Sugarloaf Peak covers over 24 km<sup>2</sup> and was the subject of intermittent drilling and small-scale mining from the 1950s through to the 1990s. The project is the subject of a historical, non-National Instrument 43-101 compliant mineral resource.
