

Puma Begins Drilling at Nicholas-Denys Porphyry System in New Brunswick

27.03.2014 | [Marketwired](#)

RIMOUSKI, QUEBEC--(Marketwired - Mar 27, 2014) - Puma Exploration (TSX VENTURE:PUM) has started a drill program on 12 exploration targets on its 100-per-cent-owned Nicholas-Denys project in New Brunswick. These exploration targets were defined by the recent IP geophysical survey (48km-line) conducted over the entire 16km square granodiorite and the surrounding skarn horizons.

Preliminary observations from the trenching program done in December over some of the IP geophysical anomalies showed that all of the chargeability anomalies are caused by sulphide mineralization. Results from the trenching program will be released soon. Deep drilling on the edge of one of the prospective anomalies returned continuous copper and molybdenum mineralization over 591 meters. (Press Release 22/10/2014). Exploration data from all work completed to date has been used to build a comprehensive geological model of the Nicholas-Denys porphyry system. This model was used to rank 29 geophysical exploration targets, including 12 high-priority drill targets.

About Puma Exploration

Puma Exploration is a Canadian mineral exploration company with advanced precious and base metals projects in Canada. The Company's major assets are the Nicholas-Denys Project and Turgeon Copper Project in New Brunswick and the Little Stull Lake Gold Project in Manitoba. Puma is focusing now its exploration efforts in New Brunswick, Canada.
