Three Bluffs Gold Deposit

The Three Bluffs gold project is a structurally controlled lode gold system hosted within oxide facies iron formation and greywackes. The deposit currently hosts a resource of 4.30 Mt at 4.91 g/t gold for 683,000 ounces gold (indicated) and 5.52Mt at 5.43 g/t gold for 965,000 ounces gold (inferred) (See press release dated April 23, 2013). To date, Three Bluffs has been drill tested along a strike length of 4.1 kilometres to depths of 500 metres below surface with gold mineralization persisting to depth where the company has identified additional mineral potential* comprising 4.5 to 7.5 million tonnes grading between 3.8 g/t and 7.3 g/t gold (see press release date April 23, 2013). *Estimates of the potential quantity and grade of additional mineral potential' at Three Bluffs are conceptual in nature as there has been insufficient exploration to define a mineral resource and it is uncertain if further exploration will result in the target being delineated as a mineral resource.
