

Drills Turn at Asher's King Mine in Nevada, USA

07.10.2014 | [CNW](#)

TORONTO, Oct. 7, 2014 /CNW/ - [Asher Resources Corp.](#) ("Asher" or the "Company") (TSX-V: ACN) is pleased to announce phase two drilling has now commenced at Asher's King Mine Project in Nevada, USA. The exploration program is comprised of 1,525m (5,000ft) of reverse circulation drilling testing 6 high priority targets to follow up on two gold intersections from the eastern gold zone encountered in the initial 2013 program, and, to further evaluate a distinctive copper – gold porphyry target defined in the first half of 2014.

The King Mine Project is located in Mineral County, Nevada, approximately 10 miles east of the past producing Rawhide gold mine on the Walker Lane Trend.

"We are pleased to report that our phase two exploration drilling program is now underway at King Mine as we test our next 6 high priority targets" commented Richard Buzbuzian, President and CEO Asher Resources.

About King Mine:

Rock sampling results ranged from 0.23 g/t Au to 55.7 g/t Au above a 0.20 g/t Au cut-off and conforms to historic sampling (2002) which had a high value of 28.56 g/t Au over a 1.83 m chip sample. The geological mapping has delineated a strong hydrothermal overprint on andesite host rocks with zones of intense phyllic to potassic style silicification, which carries the anomalous gold values. Within the alteration envelope and IP anomaly is a swarm of rhyolite to dacite porphyry dikes. To date, the deposit model, based on geology, anomalous gold values associated with silicified zones, anomalous arsenic, antimony, copper and bismuth correlated with the gold values, and geophysical signature, suggests a porphyry copper - gold setting with potential for a near surface zone of gold mineralization and a deeper, porphyry style gold-copper deposit.
