* Core length; the Company estimates the true width of the mineralized zone at 80 to 95% of the core length.

The 2014 drilling program was managed by Consul-Teck Exploration of Val-d'Or, Quebec, which designed the drilling campaign, supervised the program and logged and sampled the core.

Consul-Teck Exploration implemented QA/QC procedures to ensure best practices in core sampling and analysis. The drill core was logged and then split, with one-half sent for assay and the other retained in the core box as a witness sample. Duplicates, standards and blanks were inserted regularly into the sample stream.

The samples in secure tagged bags were delivered directly to the analytical facility for analysis. In this case, the analytical facility was the Bourlamaque Ltee laboratory in Val-d'Or, Quebec. The samples are weighed and identified prior to sample preparation. All samples are analyzed by fire assay with AA finish on a 30g sample (0.01-10 ppm Au), with a gravimetric finish for assays over 10 ppm Au.
