VANCOUVER, BC / ACCESSWIRE / June 9, 2015 / Discovery Harbour Resources Corp. (TSXV: DHR) ("DHR" or the "Company") is pleased to announce that, in advance of its drilling program, it has completed a detailed geophysical survey at its 100% owned 2BAR Project in Nevada.

The survey is termed an I.P. (induced polarization) survey and was designed to follow the mineralization discovered in the Upper Zone at 2BAR through drilling last November, as described in the Company's press release of January 26, 2015.

This I.P. survey was successful in defining strong responses associated with the mineralization in holes 2B14-06 and 2B14-07. Further, it has defined conductors continuing to the north and northwest, under the younger Tertiary volcanic cover. These responses are targeted for drill testing during this phase of the exploration. See DHR press release dated June 9, 2015. Results from this drilling will be reported following assaying.

The responses received from this work have been combined with an I.P. survey performed during prior exploration on the property and coincide well with targets previously developed. Interpretation of the DHR dataset was performed by the chief geophysicist from Zonge Engineering. KLM Geoscience of Las Vegas, Nevada conducted the survey.

Michael J. Senn, a licensed professional geologist, is the Qualified Person for Discovery Harbour Resources as described in National Instrument 43-101 and has reviewed and approved the technical contents of this release.
