

MONTREAL, QUEBEC--(Marketwired - Sep 3, 2015) - Canada Strategic Metals Inc. ("Canada Strategic Metals" or "the Company") (TSX VENTURE:CJC)(FRANKFURT:YXEN)(OTCBB:CJCFF) and Matamec Explorations Inc. (TSX VENTURE:MAT)(OTCQX:MHREF) are pleased to report the completion of its summer exploration program on the Sakami Gold Project. The program consisted of geological and geophysical surface work in two separate areas. The first area of work was the JR area, where detailed mapping and sampling were done. A total of 303 rock grab samples were sent to the ALS laboratory in Val-d'Or for gold assaying. Work was also done on the Peninsula area, where a magnetic and electromagnetic ground survey of ± 70 km was conducted, followed by a geochemical soil survey (B horizon) on the entire Peninsula area, with systematic sampling every 50 metres on lines spaced at 100 metres. A total of 728 samples were collected and sent to the ALS laboratory to be assayed for gold and indicator minerals.

The goal of the summer program was to follow up on the various gold showings identified in the past in the JR area, which returned grades of up to 61.37 g/t Au (see press release dated 24 October 2013). The program was also aimed at the planning of future drilling work in this area. Work on the Peninsula area was aimed at generating new targets and possibly identifying new showings.

The Company will release the results of the program as soon as they are received and compiled.

The 2015 summer exploration program was supervised by Consul-Teck Exploration of Val-d'Or, Québec, who also designed the program and carried out all the geological surveying and sampling.

About Sakami

The "25" Zone and Eleonore Mine mineralization: 6 similarities

The Sakami Property ("Sakami") is located in Archean rocks of the Superior Province, in the transition zone between the La Grande and Opinaca Subprovinces ("La Grande" and "Opinaca", respectively). Elsewhere in the region the contact between the two subprovinces generally corresponds to regional-scale deformation and a sharp change in metamorphic gradient.

La Grande consists of volcano- sedimentary packages linked to greenstone belts (15%), intruded by syn-to post-tectonic tonalites, granodiorites and granites (85%), with the volcanics and sediments deformed around the more resistant intrusives. Metamorphic grade increases from greenschist facies to the amphibolite facies toward the contact with the Opinaca. The Opinaca consists of metamorphosed and folded sedimentary rocks such as paragneisses and migmatites creating E-W trending domes and basins, intruded by syn- to post-tectonic tonalites, granodiorites, granites and pegmatites.

The "S-shaped" La Grande surrounds the Opinaca on its west and north sides, spanning a distance of 450 km in the E-W direction and of 250 km in the N-S direction. Regional faults are mainly present in La Grande and are oriented N-S, E-W and NW-SE defined on outcrop by either a strong tectonic banding or intense shearing with mylonitization.

Goldcorp's producing Eleonore gold deposit ("Eleonore") (December 2014 reserves from the Goldcorp website: 19.3 million tonnes @ 6.5 g/t gold for 4 million ounces of gold; Inferred Resource: 13.25 million tonnes @ 9.63 g/t gold for 4.1 million ounces of gold) sits in La Grande straddling the contact with the Opinaca, some 140 km SE of the Sakami property. The host rocks at Eleonore are conglomerates, greywackes (containing aluminosilicate porphyroblasts), mudstones-argillites, cherts, and intrusive diorites and pegmatites. The mineralization is hosted in a series of near vertical lenses, and is contained in five zones consisting of gold, quartz and 1% to 5% arsenopyrite (As sulphide) veinlets and stockworks within gold-bearing quartz-carbonate-K feldspar-biotite-arsenopyrite-pyrrhotite (magnetic Fe sulphide) alteration haloes. Minor sulphides include pyrite (Fe sulphide), sphalerite (Zn sulphide), bornite (Cu oxide) and chalcopyrite (Cu sulphide). The lenses are generally 5 metres to 6 metres in true thickness within a wider range of 2 metres to 20 metres. The mineralized zones tend to be folded with thickening in the hinge of folds. Eleonore is thought to belong to a clastic-sediment-hosted stockwork-disseminated end member of the classic greenstone-hosted quartz-carbonate vein deposits, such as those found in the Timmins Camp within the Ontario segment of the Abitibi Greenstone Belt.

At Sakami, work done by Matamec in the southern Long Point claim area from 2000 to 2004 and more recently by Canada Strategic Metals (since early 2014) identified and delineated a number of proximal gold mineralized lenses linked to greywackes, paragneisses, sulphidized iron formations and felsic dykes. The "25" Zone has the most significant gold potential, having been drill-tested (by 62 holes for 13,280 metres) over a 250-metre strike length to a vertical depth of 500 metres. Here, gold is accompanied by finely disseminated 1% to 5% arsenopyrite and minor pyrrhotite, particularly in quartz-tourmaline veins. The higher grade gold is generally associated with a lower gold grade halo of 1 to 3 g/t gold material (EX-31: 10.02 g/t gold over 2.82 metres within an envelope of 2.47 g/t gold over 27.05 metres). The mineralization is accompanied by abundant silica-sericite-K feldspar alteration, with silica flooding being dominant. The mineralization averages 10 metres wide in a range of 8 metres to 50 metres.

Sakami has a number of similarities to Eleonore: (i) it is located at the boundary between the La Grande and Opinaca subprovinces; (ii) it is hosted by metamorphosed sedimentary units; (iii) it has multiple lenses; (iv) it contains arsenopyrite; (v) it has an abundance of a wide alteration corridor with quartz-K feldspar; and (vi) its higher gold grades are accompanied by wider

and lower gold grades. The focus at Sakami will be to delineate the size potential of the "25" Zone mineralization in order to produce a geological-resource model in the near term.

Jean-Sebastien Lavallée (OGQ #773), geologist, shareholder, President and Chief Executive Officer of the Company and a Qualified Person under NI 43-101, has reviewed and approved the technical content of this release.

About Canada Strategic Metals

Canada Strategic Metals is an emerging company focused on the exploration and development of a number of projects covering over 20,000 hectares in Quebec. With broad management experience in green technology and junior resource exploration and development, Canada Strategic Metals is well positioned to aggressively advance this promising property portfolio for its shareholders.
