

TORONTO, ONTARIO--(Marketwired - May 6, 2016) - [NewCastle Gold Ltd.](#) (TSX VENTURE:NCA) (the "Company" or "NewCastle") is pleased to announce that, further to the Company's news release dated April 14, 2016, the Company has issued 357,143 common shares (the "GMP Shares") to GMP Securities L.P. ("GMP") in settlement of the fees payable to GMP in connection with the fairness opinion provided to the NewCastle board of directors in connection with the previously announced plan of arrangement with [Catalyst Copper Corp.](#) The GMP Shares are subject to a hold period that expires September 7, 2016.

Neither TSX Venture Exchange nor its Regulation Services Provider (as that term is defined in the policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this release.

About NewCastle

NewCastle has 100% of the right, title and beneficial interest in and to the Castle Mountain Venture, a California general partnership, which owns the Castle Mountain property (the "Project") in San Bernardino County, California. The Castle Mountain heap leach gold mine produced over one million ounces of gold from 1992 to 2001, when mining was suspended due to low gold prices. The Mine and Reclamation Plan, under which the mine operated, was authorized by the County of San Bernardino as the Lead Agency and remains in effect. Water for the drill programs was accessed from existing patented wells on the Project.

An updated NI 43-101 resource for the project was announced December 2, 2015 which includes Measured Mineral Resource of 17.4 million tonnes grading 0.86 g/t containing 0.48 million ounces, Indicated Mineral Resources of 202.5 million tonnes grading 0.57 g/t gold and containing 3.71 million gold ounces along with Inferred Mineral Resources of 40.8 million tonnes grading 0.58 g/t gold and containing 0.76 million gold ounces. The Project hosts a disseminated low sulphidation epithermal system. Gold is primarily hosted by late-stage rhyolite volcanic units within zones of silicification and brecciation associated with northeast-southwest trending/southeast dipping fault structures which are interpreted to have developed within a collapsed caldera environment. Eleven gold domains are represented by both steep and shallow-dipping orientations.

Ian R. Cunningham-Dunlop, P. Eng., the Company's Vice President Exploration, is the designated Qualified Person for this news release within the meaning of NI 43-101. He has reviewed and verified that the technical information contained in this release is accurate and has approved of the written disclosure of the same.

Cautionary Note Concerning Estimates of Inferred and Indicated Resources

This news release uses the terms "Inferred Resources" and "Indicated Resources," which have a great amount of uncertainty as to their existence, and great uncertainty as to their economic and legal feasibility. It cannot be assumed that all or any part of an Inferred and/or Indicated Mineral Resource will ever be upgraded to a higher category. Under Canadian rules, estimates of Inferred Resources may not form the basis of feasibility or other economic studies. NewCastle advises U.S. investors that while this term is recognized and required by Canadian regulations, the U.S. Securities and Exchange Commission does not recognize it. U.S. investors are cautioned not to assume that part or all of an Inferred and Indicated resource exists, or is economically or legally minable.
