

# ML Gold intersects 230 m with Visual Copper Mineralization Over 1km Away From Previously Reported Drilling on Stars Project - Increases Land Positions in Central BC

01.02.2018 | [Newsfile](#)

Vancouver, Feb. 1, 2018 - [ML Gold Corp.](#) (TSXV: MLG) ("ML Gold" or the "Company") is pleased to announce it has intersected a 230 metre interval with visual copper and molybdenum at its Stars project in Central BC. This hole was drilled into target area B ("Target B") over 1 kilometre (km) west of the previously reported drilling. While observed mineralization in hole 5 is not visually as intense as in hole 4, it is probable that the mineralization is part of the same system identified 1 km to the east, indicating that the system is much larger than previously thought.

Hole 5 (DD18SS005) encountered visible copper and molybdenum mineralization occurring as veins individually ranging from 0.1 - 2 cm wide throughout an interval from 47.2 metres to approximately 277 metres depth before being truncated by a fault zone. The hole continued in variably altered intrusive rock to a total depth of 364 metres. The veins are hosted within monzo-granodiorite similar to that observed in the first 4 holes. Moderate to strong potassium feldspar alteration is present as selvages along the margins of the veins and occasional bornite is observed. True widths of the intervals are not known at this time.

Adrian Smith, President of ML Gold comments "Copper mineralization has now been observed over 1km away from hole 4 and confirms that we have a large system on our hands. Further, detailed logging of hole 4 indicates it could in a high level setting of a copper rich porphyry system. We are seeing copper veining cutting multiple rock types, including earlier copper veins, implying a large scale with multiple pulses of copper rich fluids. We feel extremely lucky that mineralization begins at surface and feel confident that it could extend to significant depth."

Core from hole 5 will be processed immediately following hole 4. Current logging and sampling of hole 4 is nearing completion and will be immediately shipped to the assay lab where the company anticipates rushing analysis on the samples.

All core samples from the Stars project are being shipped to MS Analytical labs in Langley BC for analysis, results will be made available once they have been received and reviewed for Quality Assurance and Quality Control ("QAQC").

In addition, the Company is completing a detailed airborne magnetic geophysics survey to further define the target areas within the property and assist in follow up drilling.

The Company has also increased the size of the Stars Project by an additional 1,626 hectares, and separately secured over 1,875 hectares of 100% owned mineral claims immediately to the north of, and adjoining the Huckleberry mining lease currently owned by [Imperial Metals Corp.](#)

## Qualified Person

Adrian Smith, P.Geo., is the qualified person for the Company as that term is defined in National Instrument 43-101, and has supervised the technical information presented within this news release.

## ABOUT ML GOLD CORP.

[ML Gold Corp.](#) is a Canadian company listed on the TSX Venture Exchange, focused on creating

shareholder value through discoveries and strategic development of mineral properties in Canada and the United States.

For additional information please visit the Company's website at [www.mlgoldcorp.com](http://www.mlgoldcorp.com). You may also email [info@mlgoldcorp.com](mailto:info@mlgoldcorp.com) or call investor relations at (604) 669-2279.
