

# Tasca Options Handcamp Property in Newfoundland, Canada

05.09.2018 | [FSCwire](#)

Vancouver, British Columbia (FSCwire) - Tasca Resources Ltd. ("Tasca" or the "Company") (TSX.V: TAC, FSE: 3TA) is announce the acquisition of the 2,100 hectare Handcamp property from Arm's Length vendors. The Handcamp has been explored for base metals since the 1960's and has only recently been recognized for its gold potential. A diamond drilling program in 2010 returned highlight gold values of 6.3 g/t Au over 1.9m and 10.8 g/t Au over 0.9m within a zone of 3.1 g/t Au over 5.9m or 1.2 g/t Au over 20.9m in Hole 004; 1.53 g/t Au over 12.6m in Hole 005; and 5.5 g/t Au over 17.8m within a wider interval of 3.5 g/t Au over 3.5m or 1.0 g/t over 17.8m in Hole 012. True width is estimated at 75% and full protocols were instituted. Eleven of the 12 holes were drilled in three fences spaced 250 to 300 metres apart, while hole 012 was drilled to test the area of a 31 g/t Au float sample approximately 550 metres to the southwest of hole 004. Plus 1 g/t Au intersections over 0.60m to 1.00m were recorded in all but two of the remaining 9 holes. Tasca cautions investors the Company has not yet verified the historical data.

President Clive Massey states, "Tasca continues to believe in the exceptional exploration potential of Newfoundland and pleased with this opportunity to acquire the option on the Handcamp property. The intersection of plus 1 gram gold intersections over a strike length of 850 metres in 2010 strongly suggests a robust gold system occurs at Handcamp. Tasca plans an aggressive exploration program once the technical team has reviewed and compiled the historic data set."

The road accessible Handcamp property is comprised of 5 licenses totalling 84 claims and lies 15 kilometres south of the village of South Brook or 115 kilometres east of Deer Lake. Handcamp lies in the Dunnage Zone, a series of Cambrian to mid-Ordovician island arc and back arc ophiolite and marine volcanic- sedimentary sequences. The claims are underlain by Ordovician Roberts Arm Group submarine volcanic and volcanogenic sedimentary rocks. The gold mineralization appears related to felsic volcanic and volcanoclastic rocks accompanied by abundant red and ferruginous chert in zones up to 500 metres wide.

Soil geochemistry, rock geochemistry, mechanical trenching and Induced Polarization geophysical surveys are included in the historical database and need to be compiled and analyzed to direct the next phase of drilling at Handcamp.

Under the terms of the Option Agreement, Tasca will make cash payments of \$40,000, issue 4,250,000 shares and contribute \$2,400,000 in exploration expenditures over the next four years. The Vendors will retain a 2% Net Smelter Return Royalty. Tasca will have the option to purchase 50% of this royalty for \$1,000,000 at any time. The Agreement is subject to approval by the Venture Exchange (the "Exchange").

## About Tasca Resources

[Tasca Resources Ltd.](#) (TAC: TSX-V) is a Canadian-based mineral exploration company focused on the acquisition, exploration and development of mineral properties. Our objective is to build shareholder value through exploration and development or acquisition of existing projects with significant up-side.
