

Portofino Reports Sampling Results-Rio Grande Salar, Argentina

18.09.2018 | [Newsfile](#)

Vancouver, September 18, 2018 - [Portofino Resources Inc.](#) (TSXV: POR) (FSE: POT) ("Portofino" or the "Company") is pleased to announce results from its 2018 exploration/evaluation program on the Rio Grande Sur lithium brine project in Catamarca, Argentina. The exploration program included geological mapping and pit and auger sampling of near-surface saline brines to depths down to 1 meter. In total, 13 sample sites were tested within the project concessions with samples returning values of up to 216 mg/L lithium (Li), and up to 4,185 mg/L potassium (K). All brine samples were analyzed by Alex Stewart Analytical Laboratory in Mendoza, Argentina.

The Company's Rio Grande Sur concessions cover one of the primary water sources for the main Rio Grande salar brines located immediately to the north. The results of the 2018 sampling program indicate that there are locations where Li is being concentrated (up to 216mg/L) on the Property. Of interest to the Company is the presence of Li in spring-sourced surface waters, which indicates that this area may also be a key source of Li for the salar.

The Rio Grande Sur project comprises 3 mineral concessions totaling approximately 8,500 hectares and consolidates the southern extension of the Rio Grande salar in Catamarca. The property is adjacent to the Rio Grande concessions held by [LSC Lithium Corp.](#) ("LSC") wherein LSC has reported an initial Mineral Resource estimate*.

David Tafel, Portofino's CEO stated: "The initial due diligence sampling program has been successful in identifying specific areas within the concession to focus the next stage of our exploration which will involve generating drill targets to test the project at depth."

A table of results can be found at the follow link:
