

Origin Gold Corp. Outlines its Exploration Program on La Pantera and provides a Corporate Update

08.01.2019 | [GlobeNewswire](#)

MONTREAL, Jan. 08, 2019 - [Origin Gold Corporation](#) ("Origin or the "Corporation") (TSX VENTURE: OIC) is pleased to announce preliminary results of its first surface exploration program on the La Pantera property (the "Property").

The surface exploration program on the Property covers an area of 1,734 hectares (about 5.0 km by 3.5 km), located in the gold rich San Lucas Range, department of Bolivar, in Colombia.

The program is based on recommendations of the National Instrument ('NI') 43-101 technical report dated August 20th, 2018, prepared by Pierre O'Dowd.

The definition and description of the areas of superficial mining artisanal workings in saprolite (weathered bedrock) and geological mapping have been undertaken. The magnetic ("MAG") survey, trenching and the inspection of the underground mining works are in progress. The following additional activities are also being performed at this time:

- Detail geological campaign and trenching to identify and characterize the veins and breccia zones;
- Systematically sampling and assaying for gold of all veins, veinlets, breccia and alteration zones; and
- Drone airborne survey to build orthomosaic maps of the whole area. The survey is also needed to obtain the exact location of the widespread and numerous artisanal surface operations, as shown on the following preliminary map (blue areas on the map)

PRELIMINARY RESULTS

Geology

The property is underlain by granitoid lithology affected by saprolitization for 60% approximately, mainly on the northern portion. The thickness of the saprolite, where remnants of veins, veinlets and breccia zones can be observed, ranges between 5 to 15 meters. Many new evidences of former underground activities have been located. Quartz injected deformation zones are common on the property with northeast ("NE") preferential direction.

Magnetometrics

The preliminary interpretation of the MAG survey has been able to confirm one of those NE oriented deformation zones in the northeastern corner of the concession associated with active and inactive artisanal mine workings.

Trenching

Most of the trenches were dug to confirm the presence into the Property of the large quartz injected deformation zone identified to the NE. Gold evidence was found by panning quartz-rich material at the bottom of four trenches.

In the Matos area the trenches were able to identify a quartz vein system returning values between 0.2 to 3.9 g/t gold.

Qualified Person

This news release has been reviewed and approved by Pierre O'Dowd, P. Geo., BS.c. Geology, an independent Qualified Person as defined by NI 43-101.

Resignation of a Director

Origin Gold announces the resignation of Mr. Pierre Colas as director of the Corporation. Origin Gold's Board and management would like to thank Mr. Colas for his contribution to the Corporation.

Grant of Stock Options

The Board of Directors of Origin has approved the granting of options for 1,160,000 common shares of the Corporation to the Directors, Officers and consultants of the Corporation, in accordance with its stock option plan. The options vest immediately, are exercisable at \$0.10 per option and have a term of 2 years.

About Origin

Origin is a mineral exploration company with its exploration activities focused in Colombia.
