# Boreal Expands Discovery Zone of High-Grade Zinc, Silver and Lead Mineralization at Gumsberg Project in Sweden

04.03.2019 | CNW

VANCOUVER, March 4, 2019 - <u>Boreal Metals Corp.</u> ("Boreal" or the "Company") (TSXV:BMX) is pleased to report ass for the remaining four holes from the recently completed nine hole 1,620.8 metre diamond drill program at its 100% ow Gumsberg project located in the prolific Bergslagen Mining District in southern Sweden (see Figure 1).

"The continued success intersecting multiple high grade precious and base metal massive sulphide mineralization in th Zone is very exciting for the Boreal team, as our initial thesis was always to prove that around these old relatively untes workings new economic discoveries could be found," stated Patricio Varas, Executive Chairman. "These intercepts inconfidence in the upside exploration potential throughout the + 20 km long belt land position which has not been exploration methods." Mr. Varas added "textures in massive sulphides intercepted previously were interpreted remobilized massive sulphide veins however these new results contain textures that we interpret to represent primary \text{\textures} mineralization. A down hole geophysical survey scheduled for first quarter of 2019 will help us vector toward what coul be new discoveries at Östra Silvberg."

These results establish continuity in the newly discovered South Zone, where the Company plans to conduct additional the spring using funds from the recent private placement (see Boreal News Release dated February 20, 2019) to contine expand this new discovery. Assay results for the final holes of the 2018/2019 program are summarized in the following

Hole From To Length Zn Ag Pb Cu Au

ID Meters Meters Meters % g/t % % g/t

GUM-18-06 210.84 223.44 12.60 6.73 18.53 1.99 0.13 0.08

GUM-18-07 103.58 104.75 1.17 2.67 32.00 1.27 0.02 0.44

GUM-18-08 190.75 196.40 5.65 8.75 289.32 4.67 0.04 1.08

GUM-18-09 105.02 105.94 0.92 3.98 32.80 0.94 0.15 0.23

In December 2018 and January 2019, Boreal completed nine diamond drill holes in the vicinity of the past producing Ös Mine (Figure 1). Diamond drilling tested prospective stratigraphy east, west and down-plunge of the previously reporte from BM-17-005, which returned 10.94 metres of 16.97% zinc 656.7 g/t silver, 8.52% lead and 0.76 g/t gold south of the Silvberg mine workings (see Boreal News Release dated February 28, 2018).

Table 1. Drill Intercepts for holes GUM18-004 through GUM18-009 from Boreal's Gumsberg 2018-19 Diamond Drill Pro

Holes GUM-18-006, GUM-18-008 and GUM-18-009 were drilled to test down-plunge and along-strike continuity of new recognized remobilized silver-zinc-lead-gold mineralization that occurs 50 metres south of the historical workings which intercepted in BM-17-005 in Boreal's 2017/2018 program and again in holes BM-18-003 and BM-18-004 (this program) GUM-18-007 tested the down plunge extent of historically mined mineralization exposed at surface (Figures 1 and 2). GUM-18-006 through GUM-18-009 were successful in expanding the newly discovered zone (Table 1). Drill hole GUM two zones of pyrite-rich massive sulphide lenses which returned significant lead-zinc mineralization interpreted to repre primary sulphide source of the remobilized sulphides. The presence of high grade remobilized veins and primary volca massive sulphide mineralization significantly upgrades the potential at Östra Silvberg.

Six of the nine holes drilled at the Östra Silvberg cut significant mineralization which constitutes an expanding zone of r

recognized mineralization that remains open to the east and at depth.

# The Gumsberg Project

The strategically situated Gumsberg project consists of six exploration licenses in the Bergslagen Mining District of sou Sweden totaling over 18,300 hectares, where multiple zones of VMS style mineralization occur. The VMS mineralization Gumsberg was mined from the 13th century through the early 1900s, with over 30 historic mines present on the proper notably the Östra Silvberg Mine which was the largest silver mine in Sweden between 1250 and 1590. Despite its long production history, relatively little modern exploration has taken place on the project. New geologic interpretations, geosurveys and reconnaissance drilling have led to the identification of multiple new exploration targets near the historic was

About Boreal Metals Corp.

Boreal is a mineral exploration company focused on the discovery of zinc, copper, silver, gold and cobalt deposits in exhistorical mining project areas spanning Sweden and Norway. The Company aims to discover new economic mineral known mining districts that have seen little or no modern exploration techniques. The Company is led by an experience management team and technical team, with successful track records in mineral discovery, mining development and find
