In the news release, High Grade Silver Results, Including 6 Metres at 232 g/t Ag, Enhance San Marcial Project, issued 04-Sep-2019 by [Goldplay Exploration Ltd.](#) over CNW, we are advised by the company that the hyperlink referenced in the paragraph has been amended. The complete, corrected release follows:

High Grade Silver Results, Including 6 Metres at 232 g/t Ag, Enhance San Marcial Project

VANCOUVER, Sept. 4, 2019 - [Goldplay Exploration Ltd.](#) (TSXV: GPLY, FRANKFURT: GPE, OTCQB: GLYXF) ("Goldplay Company") is pleased to announce that additional high-grade silver (Ag) has been encountered in a re-opened old adit at the Faisanes target (Figure 1) on the edge of the NI 43-101 silver resource area at the Company's San Marcial Project (San Marcial), Sinaloa, Mexico, as announced in February this year (see News Release dated 7 February 2019).

Channel sampling along the walls of the historical tunnel, originally opened by artisanal miners, returned a high-grade silver zone containing 6 m at 232 g/t Ag (Table 1). The interval ended in high-grade material at the deepest sampled point within the tunnel. The Company is reviewing plans to extend the tunnel beyond this high-grade interval. The high-grade silver zone is within a broader zone of 11 m at 155 g/t Ag which commences at the opening of the shallow tunnel.

The high-grade silver in tunnel T-002 provides depth continuity, and correlates well with high-grade results in trench SMtr-001 which included 15 m at 472 g/t Ag within a broader zone of 56 m at 196 g/t Ag (Figure 2). Individual channel samples from the SMtr-001 trench reached as high as 1 m at 1,685 g/t Ag and 1m at 1,228 g/t Ag (see News Release dated 21 February 2019). The highest grade in tunnel T-002 is 1 m at 353 g/t Ag, providing continuity of the high grades at depth. This also correlates with high-grade silver grades up to 248 g/t Ag in drill hole SM-19-01. The drill hole, tunnel and surface trench are all located within the Faisanes target area; a potential extension of the breccia-hosted silver mineralization in the adjacent resource area.

Goldplay President and CEO Marcio Fonseca commented, "Over recent months, our exploration activities to expand the San Marcial 43-101 silver resources at San Marcial have succeeded in delineating new high-grade gold targets, but we have also discovered new silver zones peripheral to the resource area. These latest high-grade silver results, including 6m at 232 g/t Ag, from the re-opened historical adit at the Faisanes target, on the NW edge of the resource area provide lateral and depth continuity with the high-grade silver results reported from our nearby surface trench SMtr-001, which returned 56m at 196 g/t Ag. We expect to extend this target further in our current drilling program, which already has identified bonanza-grade gold (1m at 204.6 g/t Au) in the adjacent SM-19-01."

Table 1: San Marcial Tunnel T-002: Best assay results

Tunnel	From (m)	To (m)	Sample Length (m)	True Thickness (m)	Grade Ag (g/t)	Grade Pb (%)	Grade Zn (%)
T-002 including	0.0	11.0	11.0	9.5	155	0.14	0.56
	5.0	11.0	6.0	5.2	232	0.19	0.62

Channel lengths are measured starting from the opening of the tunnel. All numbers are rounded. Mineralized zones are reported allowing for maximum 1 m of internal waste. High grade interval uses 80 g/t Ag cut-off grade and low-grade interval uses 20 g/t Ag cut-off grade.

The potential of the Faisanes target area, to the NW of the San Marcial resource area, is demonstrated in Figures 2 and 3. The figures show the three dimensional relationship between the high grade silver mineralisation encountered in tunnel T-002 as well as the

trench SMtr-001, and the recently reported high grade gold in SM-19-01. Further drilling of this target is planned in the current drilling program, to test the potential to expand the existing resource.

CURRENT DRILL PROGRAM

The Company is executing its San Marcial resource expansion strategy with its initial drill program at Faisanes and at Nava.

Phase I drilling at San Marcial brought immediate success with drill hole SM-19-01 intersecting a very high-grade gold interval of 10 m at 204.6 g/t Au at the Faisanes target on the western edge of the Resource (Figure 1). This high-grade gold intercept was followed up with detailed geological and geochemical modelling. Findings from these newest studies strongly support further exploration along 600 metres of strike length at Faisanes in the Phase I drilling program. The discovery of a high-grade gold mineralization associated with high grade silver and base metals (Pb-Zn), opens the exploration at San Marcial. The Company anticipates completing approximately 3 additional core drill holes at Faisanes during the current program to follow up on SM-19-01.

Drill hole SM-19-02, testing the Nava gold target 150 m beneath the broad gold interval in trench SMtr-020 that returned 2.1 g/t Au (including 5 m @4.0 g/t Au), is now complete and SM-19-03 is currently underway, testing an easterly extension of the Nava target. The Nava target is located 1.5 km west of the San Marcial resource area and approximately 1 km west of the Faisanes discovery. A 500 m-long gold mineralized zone has been defined at Nava. For further details, see News Release dated 10 July, 2019. Logging and sampling of SM-19-02 is now complete with laboratory analyses pending.

Qualified Person

The scientific and technical data contained in this news release related to the San Marcial Project was reviewed and/or approved under the supervision of Marcio Fonseca, P.Geol., a non-independent qualified person to [Goldplay Exploration Ltd.](#), who is responsible to ensure that the geological information contained in this news release is accurate and who acts as "qualified person" under the National Instrument 43-101 Standards of Disclosure of Mineral Projects.

Quality Assurance Program and Quality Control Procedures ("QA/QC")

Goldplay has implemented QA/QC procedures which include insertion of blank and standard samples in all sample lots. All samples are analyzed at SGS de México, S.A. de C.V laboratory facilities in Durango, Mexico, for sample preparation and assaying. For every sample with results above Ag >100 ppm (over limits), these samples are submitted directly by SGS de Mexico to SGS Canada Inc in Vancouver, BC. The analytical methods are 4-acid Digest and Inductively Coupled Plasma Optical Emission Spectrometry with Lead and Silver Fire Assay with gravimetric finish for silver above over limits. For gold assays the analytical methods are Lead Fusion and Atomic Absorption Spectrometry Lead Fusion Fire Assay and gravimetric finish for gold above over limits.

About Goldplay Exploration Ltd.

Goldplay has successfully consolidated a district-sized portfolio, owning >250 sq. km of mineral concessions in the historic gold-silver Mining District in the state of Sinaloa, Mexico. Its flagship project, San Marcial, consists of a 1,250 ha land parcel located south of the La Rastra and Plomosas historic mines. San Marcial is a near-surface, high-grade silver, lead, and zinc pit amenable project for which a NI 43-101 resource estimate was completed by Goldplay in early 2019. Additionally, bonanza-grade gold was drilled in July 2019 at San Marcial, opening up the potential for further gold success. Goldplay's other owned El Habal precious metals project is located 20 km west of the San Marcial Project. It comprises 3,700 hectares and is located 75 km southeast of the modern coastal port of Mazatlán, and 10 km on a paved road from the historic mining town of Rosario, Sinaloa, Mexico.

Goldplay's current focus includes expanding its NI 43-101 resource estimate at the San Marcial project, which contains 11Moz Ag Eq (indicated) + 11Moz Ag Eq (Inferred), by defining new high-grade gold and silver targets along the project's 6 km mineral trend. Goldplay is the first company to perform exploration work at San Marcial in over 10 years. It is a low-risk development project, fully exploration permitted and supported by the local communities to carry out all proposed exploration activities. To date, 100% of the 6 km trend has been drilled to date, highlighting the significant potential for further discoveries. The Company has identified 8 high-priority targets along the 6 km trend and is currently drilling two high-priority targets at Faisanes and Nava. Two of these exploration targets consist of old shallow pits, caved shafts and historic shallow underground workings in areas of extensive hydrothermal alteration, hosted by major regional structures in a felsic volcanic environment. Mapping and sampling by Goldplay have revealed evidence of dacite-rhyolite dome structures in a highly prospective geological environment for high-grade gold and silver discoveries.

The El Habal Project is a drill-stage project. Its oxidized gold mineralized zone outcrops along a series of rolling hills with evidence of historic shallow underground mining along a 6 km-long prospective corridor. The El Habal Project is located near the historic gold-silver Rosario Mine which operated for over 250 years.

Goldplay's team has over 30 years of experience with senior roles in exploration, financing, and development in the mining industry, including over ten years of extensive exploration experience in the Rosario Mining District, leading to previous successful discoveries.

The NI 43-101 reports for each of the San Marcial and El Habal Projects are available on SEDAR.
