

# Trillium Gold Receives Gold Centre Drill Permit and Plans to Test Continuity with Campbell-Red Lake Mine

09.02.2021 | [CNW](#)

VANCOUVER, Feb. 9, 2021 - [Trillium Gold Mines Inc.](#) (TSXV: TGM) (OTCQB: TGLDF) (FRA: 0702) ("Trillium Gold" or "Company") is pleased to announce that it has received a drill permit for the Gold Centre property, located immediately adjacent and along strike of Evolution Mining's Campbell-Red Lake Mine ("Red Lake Operations").

The announcement of the agreement to acquire an 80% interest in the Gold Centre property announced earlier in August, ideally positioned Trillium Gold in the heart of the highest-grade gold camp in North America which has produced more than 24 million ounces of gold at an average grade of more than 0.5 ounce of gold (or more than 15 grams per tonne of gold) over the last 91 years. Trillium Gold has planned a combination of new holes to target the shallower sulphide-style mineralization, similar to the Far East Zone at the Red Lake Operations, as well as deeper drilling holes designed to target both high grade and low grade mineralization. Closing of the acquisition is expected to occur this month.

Previous drilling at Gold Centre by Rupert Resources intersected Balmer volcanic rocks; favorable Balmer mafic metavolcanics hosting several gold deposits at the adjacent Red Lake Operations were identified in drill core and on surface following geological mapping and drill programs.

The discovery of the Far East Zone by Goldcorp provided further support that the southeast plunging Red Lake trend potentially extends through the Gold Centre property at depth. Underground infrastructure at the adjacent Red Lake Operations continues within 350 metres of the Gold Centre property boundary.

Bill Paterson, Head of Exploration for Trillium Gold added, "With favourable Balmer volcanics having been intersected at the Gold Centre property, similar to the adjacent two mines that have produced more than 24 million ounces at an average of 15 g/t Au to date, the potential for extensions of both high grade and sulphide mineralization makes Gold Centre a high priority target."

Russell Starr, CEO of Trillium Gold commented, "You could say that this drill program represents a once in a lifetime opportunity. We have an underexplored property located just 350 metres away from one of the biggest gold orebodies, not just in Canada but in the world. The Gold Centre property exhibits the pedigree to become a world-class asset and generate substantial value for Trillium Gold's market capitalization and shareholder base. Few companies have the catalysts in place to reward shareholders; including drilling at Newman Todd located 18 km from Evolution Mining's milling operations, and the contiguous high grade veins to be structurally connecting our Rivard property to the Newman Todd, and now the ability to drill the continuation of a world-class mine."

Following the geophysical IP survey in 2013, nine anomalous trends have been interpreted on the Gold Centre property which are identified on the North Grid as being strong to very strong. Two are indicative of a sulphide mineralization style potentially associated with complexly folded/faulted contact between the Huston conglomerate and Balmer mafic metavolcanic rocks. An additional similarly anomalous trend has been identified on the South Grid.

The technical information presented in this news release has been reviewed and approved by William Paterson, P. Geol., President of Exploration of Trillium Gold Mines and Qualified Person, as defined by NI 43-101.
