

Sanatana Commences Exploration at its Newly Optioned Oweegeee Dome Porphyry Copper-Gold Project in British Columbia's Golden Triangle

31.08.2021 | [Newsfile](#)

Highlights:

- Sanatana and ArcWest have confirmed the presence of at least two Cu-Au porphyry targets in the 31,077 hectare Oweegeee Dome project in the initial exploration that started in August 2021.
- Geological mapping and sampling and geophysical surveys are focused on defining the Cu-Au porphyry drill targets for the planned 2022 field season.
- 3-D IP/RES ground geophysical survey commenced and field work completed over primary target on August 25.
- Mapping and sampling confirm Cu-Au porphyry potential of untested Malloy zone of the large 2km by 2km Delta prospect.

Vancouver, August 31, 2021 - Sanatana Resources. (TSXV: STA) ("Sanatana" or the "Company") has initiated exploration at the Oweegeee Dome copper-gold project located within the famous "Golden Triangle" of northwest British Columbia (see news release of July 21, 2021 for further details on the Oweegeee project). The Oweegeee Dome project is under option from ArcWest Exploration and is situated approximately 45 km east of the giant KSM-Iron Cap porphyry Cu-Au deposits (Seabridge Gold) and Tudor Gold's Treaty Creek project, for which a measured and indicated resource estimate of 17 million oz Au and 93 million oz Ag was recently reported.

Peter Miles CEO states, "Sanatana is both excited to initiate exploration at the Oweegeee Dome project and to be working with Tyler Ruks and Jeff Kyba and their team at ArcWest Exploration. Oweegeee is an underexplored copper gold porphyry system lying within a region that is a proven host for exceptional copper-gold deposits. These include Newcrest Mining-Imperial Metals' jointly owned Red Chris mine and [Newmont Corp.](#)'s Saddle North project, which was recently acquired from GT Gold in a \$393 million transaction."

In mid-August Sanatana mobilized a field crew to the Bell 2 camp, approximately 25 km north of the Oweegeee Dome project. The property hosts multiple Cu/Au occurrences some associated with porphyry dykes and intrusives that occur over a 20km² area and have received limited previous exploration. The 2021 Oweegeee Dome exploration is focused on the highly gossanous Delta prospect and peripheral areas, as it is the most developed.

The Delta prospect comprises three zones separated mainly by geography, named Delta, Snowpatch and Malloy. Alteration is noted throughout the Delta prospect and is dominated by QSP (quartz, sericite pyrite), clay-pyrite alteration and phyllic-style alteration.

Historical shallow drilling of the Delta prospect focused on a copper-in-soil anomaly at an easily accessible ridge with an Eskay Creek target in mind. Multiple drill holes intersected intensely altered QSP/clay-pyrite, altered diorite and porphyritic intrusions and intrusive breccias. Breccia fragments of porphyry-style veins with quartz-pyrite+-chalcopyrite centrelines are locally present. The most SE holes show increased epidote and zinc mineralization which matches characteristic zoning in a copper porphyry system and indicated an exploration vector pointing to the NW as the centre. The alteration style in the drill holes is consistent to that found zoned above or beside other known copper porphyry deposits.

Mapping in 2021 progressed from the east to the west of the Delta prospect and revealed numerous outcrops of previously unrecognized diorite and diorite breccias. The mapping, previous drilling, and the

alteration are consistent with a typical Cu-Au system buried or partly buried beneath its own alteration cap.

This work has mapped strong copper bearing stockwork 'B' veins at the Malloy zone and copper-bearing potassic alteration (biotite) northwest of the Delta zone at Snowpatch Creek. Eleven historical chip/panel rock samples collected near the Malloy zone averaged 0.53% Cu, 1.09 g/t Au and 4.8 g/t Ag. Downslope of this area intrusions with quartz-chalcopyrite veining have been located, sampled and sent for assay. They occur below a prominent gossan and above a large Cu-Au soil anomaly which assayed up to 0.1% Cu and 0.9 g/t Au (Figure 1). This highly prospective area has been named the Malloy zone.

The Malloy zone is the top-priority first drill target to test the true width of the zone and the interpreted blind Cu-Au system. The Delta prospect is capped by post-mineral volcanic rocks that possibly obscure a much larger system that plunges to the north beneath this cap.

Sanatana has also commissioned an IP survey of the Delta prospect by Dias Geophysics and is conducting ground mapping and sampling in order to best locate drill collar locations

Reconnaissance mapping and sampling of additional porphyry Cu-Au targets throughout the 31,077 hectare Oweegee Dome project is ongoing. A presentation on Oweegee Dome project will be posted to Sanatana's website shortly.
