Newcrest Mining Limited - Exploration Update - September 2021

09.09.2021 | Newsfile

Highlights

- At Red Chris, drilling continues to expand the higher grade mineralisation intersected at East Ridge, with this new discovery adjacent to the East Zone continuing to return high grade intercepts, supporting the potential for resource growth.
  - RC705 returned 254m @ 1.0g/t Au & 1.1% Cu from 718m, including 80m @ 1.6g/t Au & 1.4% Cu from 852m. This hole is located 100m above RC678 (previously reported) and demonstrates continuity over 300m vertically.
  - As noted in Newcrest's June 2021 Quarterly Exploration Report, East Ridge is located outside of Newcrest's Red Chris initial Mineral Resource estimate. Mineralisation remains open to the east and at depth, with ongoing drilling to define the extent.
- At Havieron, growth drilling continues to outline high grade mineralisation outside of the initial Inferred Mineral Resource estimate.
  - HAD133W1 located in the South East Crescent, has returned 133m @ 7.0g/t Au & 0.05% Cu from 1,446m, including 55.9m @ 9.7g/t Au & 0.04% Cu from 1,449.5m, ~250m below the initial Inferred Mineral Resource estimate.
  - Higher grade zones in the Northern Breccia to the north west of the initial Inferred Mineral Resource estimate were confirmed, with HAD140 returning 29.1m @ 9.7g/t Au & 0.29% Cu from 813.2m and HAD141 returning 87m @ 1.8g/t Au & 0.05% Cu from 1,328m including 17.8m @ 5.7g/t Au & 0.14% Cu from 1,378.5m.

Melbourne, September 8, 2021 - Newcrest Mining Ltd. (ASX: NCM) (TSX: NCM) Newcrest Managing Director and Chief Executive Officer, Sandeep Biswas, said, "We are excited by our continued exploration success at Red Chris and Havieron, with our extensive growth drilling programs delivering a number of new high grade intercepts in the period. At Red Chris, results from our new East Ridge discovery demonstrate the continuity of mineralisation along strike and at Havieron we intersected several new high grade intercepts outside of the initial Inferred Mineral Resource estimate, including HAD133W1 which returned 133m @ 7.0g/t Au. These results continue to support the potential for resource growth outside of the existing resource shells."

Red Chris - Significant results since the June 2021 Quarterly Exploration Report(1):

- RC705
  - 254m @ 1.0g/t Au & 1.1% Cu from 718m
  - including 182m @ 1.3g/t Au & 1.3% Cu from 764m
  - including 80m @ 1.6g/t Au & 1.4% Cu from 852m
- RC709
  - 166m @ 0.4g/t Au & 0.49% Cu from 788m
  - including 54m @ 0.89g/t Au & 0.96% Cu from 894m
  - including 30m @ 1.1g/t Au & 1.1% Cu from 902m
- RC718
  - 298m @ 0.33g/t Au & 0.45% Cu from 820m
  - including 52m @ 0.67g/t Au & 0.75% Cu from 1,062m

Havieron - Significant growth drilling results since the June 2021 Quarterly Exploration Report(2):

- HAD133W1
  - 133m @ 7.0g/t Au & 0.05% Cu from 1,446m
  - including 55.9m @ 9.7g/t Au & 0.04% Cu from 1,449.5m

- HAD057W7
  - 23m @ 5.7g/t Au & 0.70% Cu from 613m
  - including 15m @ 8.6g/t Au & 0.96% Cu from 613m
  - 70m @ 2.2g/t Au & 0.03% Cu from 906m
  - including 12.8m @ 5.3 g/t Au & 0.02% Cu from 962.7m
- HAD140
  - 29.1m @ 9.7g/t Au & 0.29% Cu from 813.2m
- HAD141
  - 87m @ 1.8g/t Au & 0.05% Cu from 1,328m
  - including 17.8m @ 5.7g/t Au & 0.14% Cu from 1,378.5m

Red Chris, British Columbia, Canada(2)

Red Chris is a joint venture operated by Newcrest and in which Newcrest has a 70% interest.

The Brownfields Exploration program is focused on the discovery of additional zones of higher grade mineralisation within the Red Chris porphyry corridor, including targets outside of Newcrest's initial Mineral Resource estimate. During the period, there were up to eight diamond drill rigs in operation. A further 14,490m of drilling has been completed from 18 drill holes, with all drill holes intersecting mineralisation (except eleven which were dedicated geotechnical holes). This contributed to a total of 181,176m of drilling from 155 drill holes since Newcrest acquired its interest in the joint venture in August 2019.

At East Ridge, located adjacent to the East Zone, drilling is ongoing with 14 holes completed and six in progress. The follow up drilling is being completed on a nominal 100m x 100m grid to determine the footprint of the mineralisation and demonstrate the continuity of the higher grade mineralisation.

Results for the reporting period include:

- RC705 (drilled 100m above of RC678 previously reported) returned 254m @ 1.0g/t Au & 1.1% Cu from 718m, including 80m @ 1.6g/t Au & 1.4% Cu from 852m.
- RC708 (drilled 100m above of RC700 previously reported) returned 232m @ 0.16g/t Au & 0.26% Cu from 754m.
- RC709 (drilled 100m west of RC678) returned 166m @ 0.4g/t Au & 0.49% Cu from 788m, including 30m @ 1.1g/t Au & 1.1% Cu from 902m.
- RC713 (drilled 100m above RC705) returned 190m @ 0.26g/t Au & 0.41% Cu from 574m, including 28m @ 0.57g/t Au & 0.74% Cu from 712m, and
- RC718 (drilled 100m east of RC700 previously reported) returned 298m @ 0.33g/t Au & 0.45% Cu from 820m, including 52m @ 0.67g/t Au & 0.75% Cu from 1,062m.

Drilling to date has demonstrated continuity of the East Ridge zone (>1g/t AuEq) over dimensions of 400m high, 400m long and 125m wide, with the higher grade (>2g/t AuEq) over 300m high, 300m long and 100m wide.

East Ridge is located 300m east of East Zone and is outside of Newcrest's initial Mineral Resource estimate, supporting the potential for resource growth over time. Mineralisation is open to the east and at depth and extends the eastern side of the porphyry corridor as shown in Figures 1 and 2. Follow-up drilling is in progress to further define the extent and continuity of this high grade mineralisation.

A step out hole, RC701 drilled 700m east of East Ridge has extended the porphyry corridor beyond the limit of the East Ridge drilling. This hole returned 206m @ 0.2g/t Au & 0.49% Cu from 1,816m. The intercept is one of the deepest on the property. Drilling is planned for the zone between East Ridge and RC701 to search for additional high grade zones.

Approximately 50,000m of growth-related drilling is planned this calendar year from eight drill rigs.

Refer to Appendix 1 for additional information, and the Drillhole data table for all results reported during the period.

Figure 1. Schematic plan view map of the Red Chris porphyry corridor spanning East Ridge, East Zone, Main Zone and Gully Zone showing drill hole locations (Newcrest & Imperial) and significant Newcrest intercepts (drill intercepts have been reported in Appendix 1 of this report, and in prior Newcrest exploration releases). 0.5g/t Au, 1g/t Au, 1 g/t AuEq and 2g/t AuEq shell projections generated from a Leapfrog model. Gold equivalent (AuEq) grade calculated using a copper conversion factor of 1.67 ([gold grade (g/t)] + [copper grade (%) x 1.67]), using US$1,400/oz Au, US$3.40/lb Cu and 100% recovery. It is the Company's opinion that all elements included in this metal equivalents calculation have a reasonable potential to be recovered and sold.

Havieron Project, Western Australia(3)

The Havieron Project is operated by Newcrest under a Joint Venture Agreement with Greatland Gold. As announced on 30 November 2020, Newcrest has now met the Stage 3 expenditure requirement (US$45 million) and is entitled to earn an additional 20% joint venture interest, resulting in an overall joint venture interest of 60% (Greatland Gold 40%). Newcrest can earn up to a 70% joint venture interest through total expenditure of US$65 million and the completion of a series of exploration and development milestones (including the delivery of a Pre-Feasibility Study) in a four-stage farm-in over a six year period that commenced in May 2019. Newcrest may acquire an additional 5% interest at the end of the farm-in period at fair market value. The Joint Venture Agreement includes tolling principles reflecting the intention of the parties that, subject to a successful exploration program, Feasibility Study and a positive decision to mine, the resulting joint venture mineralised material will be processed at Telfer.

The Havieron Project is centred on a deep magnetic anomaly located 45km east of Telfer in the Paterson Province. The deposit is overlain by more than 420m of post mineral Permian cover. A further 10,375m of drilling has been completed from 18 drill holes, all awaiting assays. Results from 12 holes completed in the June 2021 quarter have been received, with eight holes returning significant assay intercepts in excess of 50 gram metres Au (Au ppm x length m). A total of 194,456m of drilling from 230 drill holes has been completed since Newcrest commenced exploration activity (excluding holes in progress, abandoned holes, or drill holes which have not been sampled).

Drilling in the reporting period was focused on potential resource growth at the South East Crescent, Northern Breccia and Eastern Breccia, and infill drilling the South East Crescent Zone to support the potential conversion of the Inferred Resource to Indicated. Drilling completed included:

- South East Crescent Zone Growth - assay results reported for two drill holes, one new drill hole completed, awaiting assays.
- South East Crescent Zone Infill - 10 new drill holes completed, awaiting assays.
- Northern Breccia - assay results reported for eight drill holes, four new drill holes completed, awaiting assays.
- Eastern Breccia - assay results reported for two drill holes, three new drill holes completed, awaiting assays.

At the South East Crescent, drilling targeting higher grade mineralisation at depth was conducted during the reporting period. Drilling is being conducted on 75m x 75m spacing and has been extended to 250m below the initial Inferred Mineral Resource extents. Results from two drill holes have been received, with significant results returned from HAD133W1.

Results include:

- HAD133W1
  - 133m @ 7.0g/t Au & 0.05% Cu from 1,446m
  - including 55.9m @ 9.7g/t Au & 0.04% Cu from 1,449.5m
  - including 20m @ 11g/t Au & 0.04% Cu from 1,519m

HAD133W1 has extended the high-grade mineralisation ~250m below the base of the Inferred Mineral Resource estimate. This intercept is ~150m below previously reported hole HAD133^^ (85m @ 11g/t Au & 0.29% Cu from 1,345m including 13m @ 32g/t Au & 0.46% Cu from 1,363m and including 14.5m @ 32g/t Au & 0.33% Cu from 1,396.5m). Assay results from one further hole HAD086W2 is pending. Drilling to assess the extent of the mineralisation below the South East Crescent Inferred Resource is ongoing.

HAD057W7 drilled to test lower target positions in the Northern Breccia also traversed the South East Crescent Zone within the initial Inferred Mineral Resource footprint. Results from this hole demonstrates good alignment with modelled grade and thickness within the South East Crescent zone, and supports the geological model including continuity of high grade.

Results include:

- HAD057W7
  - 23m @ 5.7g/t Au & 0.70% Cu from 613m
  - including 15m @ 8.6g/t Au & 0.96% Cu from 613m
  - 70m @ 2.2g/t Au & 0.03% Cu from 906m
  - Including 12.8m @ 5.3g/t Au & 0.02% Cu from 962.7m

A further 10 infill holes within the South East Crescent zone were completed, all awaiting assays. This drilling is designed to infill the South East Crescent Inferred Resource volume to 50m x 50m spacing to support the potential upgrade of a significant portion of the Inferred Resource to Indicated.

At the Northern Breccia, results from eight drill holes were returned and a further four new drillholes were completed (currently awaiting assays). The focus of the drilling in this zone is to expand the mineralisation and support potential resource growth. The latest drilling (75m x 75m) has extended the mineralised breccia footprint around the Inferred Mineral Resource extents with reported drill holes supporting extensions to breccia mineralisation. Drilling has confirmed and increased the continuity of mineralisation as a north-west mineralised corridor which has been identified up to 300m in length, and 100m wide, between 4300 - 4100mRL and remains open at depth. Higher grade mineralisation has been identified internal to the mineralised breccia corridor. The results include:

Results include:

- HAD089W3
  - 106.8m @ 0.96g/t Au & 0.12% Cu from 911.2m
  - including 15m @ 2.8g/t Au & 0.21% Cu from 978m

- HAD099W2
  - 126.7m @ 0.66g/t Au & 0.07% Cu from 643.3m
  - including 12.1m @ 1.3g/t Au & 0.12% Cu from 647.1m
- HAD138W1
  - 157.4m @ 0.93g/t Au & 0.21% Cu from 937.6m
  - including 16.1m @ 5.9g/t Au & 0.12% Cu from 1,043m
- HAD140
  - 29.1m @ 9.7g/t Au & 0.29% Cu from 813.2m
- HAD141
  - 87m @ 1.8g/t Au & 0.05% Cu from 1,328m
  - including 17.8m @ 5.7g/t Au & 0.14% Cu from 1,378.5m

At the Eastern Breccia two holes have returned assays (HAD084W1 and HAD141) with results from three drill holes pending. Drilling has targeted along strike from prior reported drill holes HAD083 and HAD084, over a strike length of approximately 600m. HAD141 has returned a mineralised intercept ~200m to the north west of HAD084. Drill testing and interpretation of the geological and mineralisation controls of the Eastern Breccia Zone is ongoing.

Results include:

- HAD141
  - 23m @ 1.7g/t Au & 0.01% Cu from 1,875m

Eight drill rigs are currently operational, including testing extensions of the South East Crescent Zone below 4,200mRL, extension and definition of the Northern Breccia and associated internal higher-grade zones to support potential expansion of the existing Inferred Mineral Resource. Additionally, infill drilling is being completed within the Inferred Mineral Resource limits to support ongoing mining studies.

Refer to Appendix 2 for additional information and Drillhole data table for all results reported during the period.

Wilki Project, Western Australia

The Wilki Project covers a strategic landholding of ~2,200km^2 surrounding the Telfer operation and is adjacent to the Havieron Project. Newcrest entered into this exploration farm-in and joint venture agreement with Antipa Minerals Limited on 11 March 2020.

During the period, scout reverse circulation drill testing was completed at Tyama, WEM04, Protos9, Pajero and Triangle North targets. Assay results are pending.

This completes the initial Stage 1 drill program with a total of 5,137m of drilling completed. Additional work programs are being planned for the remaining field season.

Juri Joint Venture, Western Australia

On 30 November 2020, Newcrest announced its entry into the Juri Joint Venture. Juri is a farm-in and joint venture agreement with Greatland Gold with respect to its Black Hills and Paterson Range East projects, located within the Paterson Province approximately 50km from the Telfer operation. The joint venture covers an area of approximately 248km^2.

Under the terms of the agreement, Newcrest has been granted an initial 25% joint venture interest with the potential to earn up to a 75% joint venture interest through total expenditure of A$20 million over a two stage earn-in, across a five year period. Greatland Gold will manage the Juri Joint Venture until the end of calendar year 2021, after which Newcrest has the right to be appointed as Manager.

Newcrest is currently assessing the assay results for the initial scout drill holes at Goliath, Outamind and Los Diablos targets in Paterson Range East. Initial drilling has also been completed at the Parlay and Saddle targets within the Black Hills Project. A total of 3,856m of drilling has now been completed this field season on the Juri JV.

Tennant East, Northern Territory

Work programs continue at the Tennant East project (located 300km east of Tennant Creek) with gravity surveys over the initial two target areas now completed. Follow up IP (induced polarisation) surveys will commence in September 2021 followed by scout drill testing in October 2021.

Nevada, USA

Drill activities have commenced at the Jarbidge project in north-eastern Nevada.

GJ Project, British Columbia, Canada

At the GJ Project, which is part of the Red Chris joint venture that is Newcrest operated and 70% owned, Newcrest is planning to test the depth potential of the Donnelly Zone which is part of a 10km porphyry corridor (Groat Stock). An initial program of two holes for 2,500m originally planned to commence in the September 2021 quarter has been rescheduled to the June 2022 quarter.

Appendix 1

Red Chris (70% Newcrest): JORC Table 1
Section 1: Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Core samples are obtained from core drilling. HQ and NQ diamete 6m run. Core was cut using an automatic core-cutter and half core sequences were not sampled. Core drilling was advanced with HQ3, HQ, NQ3 and NQ diameter
Drilling techniques	Core from inclined drill holes are oriented on 3, 4.5m or 6m runs us (Reflex ACTIII). At the end of each run, the bottom of hole position transferred to the whole drill core run length with a bottom of hole r
Drill sample recovery	Core recovery is systematically recorded from the commencement against driller's depth blocks in each core tray with data recorded i provided the depth, interval of core recovered, and interval of core Core recoveries were typically 100%, with isolated zones of lower
Logging	Geological logging recorded qualitative descriptions of lithology, al structure (for all core drilled - 14,490m in 18 holes- all holes interse dedicated geotechnical holes, including orientation of key geologic Geotechnical measurements were recorded including Rock Quality solid core recovery and qualitative rock strength measurements. Magnetic susceptibility measurements were recorded every metre. All geological and geotechnical logging was conducted at the Red Digital data logging was captured, validated and stored in an acQu All drill cores were photographed, prior to cutting and/or sampling t
Sub-sampling techniques and sample preparation	Sampling, sample preparation and quality control protocols are cor sampled. Core was cut and sampled at the Red Chris Mine core processing in plastic bags together with pre-numbered sample tags and group laboratory. Sample weights typically varied from 5 to 10kg. Sample style of mineralisation. Drill core samples were freighted by road to Sample preparation was conducted at the independent ISO 9001 c Veritas Commodities Canada Ltd Laboratory, Vancouver (Bureau crushed to 95% passing 4.75 mm, and the split to obtain up to 1kg sub-sampl produce a pulped product with the minimum standard of 95% pass Duplicate samples were collected from crush and pulp samples at acceptable level of variability for the material sampled and style of Periodic size checks (1:20) for crush and pulp samples and sample and recorded in the acQuire database.

Criteria	Commentary
Quality of assay data and laboratory tests	Assaying of drill core samples was conducted at Bureau Veritas. A using a 4-acid digestion followed by ICP-AES/ICP-MS determination (meth determined by 50g fire assay with ICP-ES finish (method FA350). Leco (method TC000) and mercury using aqua regia digestion follo (method AQ200). Sampling and assaying quality control procedures consisted of incl (CRMs), coarse residue and pulp duplicates with each batch (at lea Assays of quality control samples were compared with reference s verified as acceptable prior to use of data from analysed batches. Laboratory quality control data, including laboratory standards, bla results are captured in acQuire database and assessed for accura Due to the limited extent of the drilling program to date, extended c undertaken, whereby pulped samples will be submitted to an umpi extensive re-submission programs. Analysis of the available quality control sample assay results indica and precision has been achieved and the database contains no an manipulated.
Verification of sampling and assaying	The assaying techniques and quality control protocols used are co used for reporting exploration drilling results. Sampling intervals defined by the geologist are electronically assig core cutting. Corresponding sample numbers matching pre-labelle interval. All sampling and assay information were stored in a secure acQuir Electronically generated sample submission forms providing the sa each submission to the laboratory. Assay results from the laborato are loaded directly into the acQuire database. Assessment of reported significant assay intervals was verified by assessment of high resolution core photography. The verification o completed by company personnel and the Competent Person/Qua No adjustments are made to assay data, and no twinned holes hav mineralisation at various angles. There are no currently known drilling, sampling, recovery, or other accuracy or reliability of the data.
Location of data points	Drill collar locations were surveyed using a RTK GPS with GNSS v Drill rig alignment was attained using an electronic azimuth aligner Downhole survey was collected at 9 to 30m intervals of the drill ho EZ-SHOT). At the end of hole, all holes have been surveyed using (Reflex EZ-GYRO). Topographic control is established from PhotoSat topographic data topography is generally low relief to flat, with an average elevation gullies. All collar coordinates are provided in the North American Datum (N
Data spacing and distribution	The drill hole spacing ranges from 100 - 200m in lateral extent with 1.5km^2 at the East Zone, 1.5km^2 at the Main Zone and 1.5km^2 at t No sample compositing is applied to samples.

Criteria	Commentary
Orientation of data in relation to geological structure	Drilling of reported drill holes RC701, RC705, RC708, RC709, RC7 to the intrusive complex. The intrusive complex has an east-northe a north-northwest orientation. Drill holes exploring the extents of the East Ridge, East Zone, Mair intersected moderately dipping volcanic and sedimentary units cut Steeply dipping mineralised zones with an east-northeast orientatio Newcrest drill holes.
Sample security	The security of samples is controlled by tracking samples from drill Drill core was delivered from the drill rig to the Red Chris Mine core geotechnical logging, high resolution core photography and cutting Chris core processing facility. Samples were freighted in sealed bags with security tags by road t Newcrest representatives. Sample numbers are generated from pre-labelled sample tags. All plastic bags. Sample tags are inserted into prenumbered plastic ba Verification of sample numbers and identification is conducted by t sample receipt advice issued to Newcrest. Details of all sample movement are recorded in a database table. D analytical suite requested are recorded with the dispatch of sample Any discrepancies logged at the receipt of samples into the laborat
Audits or reviews	Due to the limited duration of the program, no external audits or re Internal verification and audit of Newcrest exploration procedures a

Section 2: Reporting of Exploration Results

Criteria	Commentary
Mineral tenement and land tenure status	Red Chris comprises 77 mineral tenures including five subsidiaries of Newcrest Mining Ltd. (70%) and Imper Limited is the operator of Red Chris. Newcrest Red Chris Mining Limited and the Tahltan N Government, the Tahltan Band and Iskut First Nation) Co-Management Agreement (IBCA) covering Red Ch All obligations with respect to legislative requirements standing.
Exploration done by other parties	Conwest Exploration Limited, Great Plains Developm Texasgulf Canada Ltd. (formerly Ecstall Mining Limite Corporation conducted exploration in the areas betwe Imperial Metals Corp. acquired the project in 2007 an between 2007 and 2012.
Geology	The Red Chris Project is located in the Stikine terrane town of Dease Lake. Late Triassic sedimentary and volcanic rocks of the S Jurassic 204−198 Ma) diorite to quartz monzo Gold and copper mineralisation at Red Chris consists porphyry-style mineralisation. Mineralisation is hosted main mineral assemblage contains well developed py as vein and breccia infill, and disseminations. The ma potassium feldspar-magnetite wall rock alteration.
Drill hole information	As provided.

Criteria	Commentary
Data aggregation methods	Significant assay intercepts are reported as (A) length or equal to 20m, with less than 10m of consecutive in exceeding 0.5g/t Au for greater than or equal to 10m, (C) length-weighted averages exceeding 1g/t Au for g consecutive internal dilution; (D) length-weighted ave with less than 10m of consecutive internal dilution; an greater than or equal to 10m, with less than 10m of co intercept calculations.
Relationship between mineralisation widths and intercept lengths	Significant assay intervals reported represent apparen to confirm the geological model and true width of sign
Diagrams	As provided.
Balanced reporting	This is the fourteenth release of Exploration Results f dates are 30 January 2020, 11 March 2020, 30 April 2020, 11 J October 2020, 10 December 2020, 28 January 2021, July 2021. Earlier reporting of exploration programs conducted b been reported. Exploration drilling programs are ongo subsequent Newcrest releases.
Other substantive exploration data	Nil.
Further work	Further drilling is planned to define the extents of the

Drillhole data(1)

Red Chris Project, British Columbia, Canada
Reporting Criteria: Intercepts reported are downhole drill width (not true width) Au >0.1ppm (0.1g/t Au) and minimum 20m downhole width with maximum consecutive internal dilution of 10m. Also highlighted are high grade intervals of Au >0.5ppm (0.5g/t Au), Au >1ppm (1g/t Au), Au > 5ppm (5g/t Au), Au >10ppm (10g/t Au) and minimum 10m downhole width with maximum consecutive internal dilution of 10m. Gold grades are reported to two significant figures. Samples are from core drilling which is HQ or NQ in diameter. Core is photographed and logged by the geology team before being cut. Half core HQ and NQ samples are prepared for assay and the remaining material is retained in the core farm for future reference. Each assay batch is submitted with duplicates and standards to monitor laboratory quality. Total depth (end of hole) is rounded to one decimal place for reporting purposes.

Hole ID	Hole Type	Easting (m)	Northing (m)	RL (m)	Total Depth (m)	Azimuth (GRID)	Dip	From (m)	To (m)	Interval (m)	Au (ppm)	Cu (pct)	Cut off

Appendix 2
Havieron Project (Greatland Gold Plc - Joint Venture Agreement): JORC Table 1
Section 1: Sampling Techniques and Data

Criteria	Commentary
Sampling techniques	Core samples are obtained from core drilling in Proterozoic basem core was drilled on a 6m run. Core was cut using an automated co intervals with breaks for major geological changes. Sampling interv sequences were not sampled.

Criteria	Commentary
	Permian Paterson Formation cover sequence was drilled using mu observed to approximately 420m vertically below surface. Steel ca pre-collar.
Drilling techniques	Core drilling was advanced from the base of the cover sequence w configuration. Core from inclined drill holes are oriented on 3m and 6m runs usin (Reflex ACTIII). At the end of each run, the bottom of hole position transferred to the whole drill core run length with a bottom of hole r
Drill sample recovery	Core recovery is systematically recorded from the commencement against driller's depth blocks in each core tray with data recorded i provided the depth, interval of core recovered, and interval of core Core recoveries were typically 100%, with isolated zones of lower Cover sequence drilling by the mud-rotary drilling did not yield reco
Logging	Geological logging recorded qualitative descriptions of lithology, al structure (for all core drilled - 10,375m for 18 drill holes, all intersec of key geological features. Geotechnical measurements were recorded including Rock Quality solid core recovery and qualitative rock strength measurements. Magnetic susceptibility measurements were recorded every metre. intervals was determined at site on whole core samples. All geological and geotechnical logging was conducted at the Havi Digital data logging was captured on diamond drill core intervals or acQuire database. All drill cores were photographed, prior to cutting and/or sampling t The logging is of sufficient quality to support Mineral Resource esti
Sub-sampling techniques and sample preparation	Sampling, sample preparation and quality control protocols are con sampled. Core was cut and sampled at the Havieron core processing facility 2.0 m were collected in pre-numbered calico bags and grouped in Sample weights typically varied from 0.5 to 8kg. Sample sizes are mineralisation. Drill core samples were freighted by air and road to Sample preparation was conducted at the independent ISO17025 (Intertek). Samples were dried at 105ºC, and crushed to 95% pass 3kg sub-sample, which was pulverised (using LM5) to produce a p of 95% passing 106μm. Routine grind size analysis is condu Duplicate samples were collected from crush and pulp samples at acceptable level of variability for the material sampled and style of Periodic size checks (1:20) for crush and pulp samples and sample and recorded in the acQuire database.

Criteria	Commentary
Quality of assay data and laboratory tests	Assaying of drill core samples was conducted at Intertek. All samp 4-acid digestion followed by ICP-AES/ICP-MS determination (meth provide a total assay for copper. Gold analyses were determined b FA50N/AA), which is considered to provide a total assay for gold. Sampling and assaying quality control procedures consisted of incl (CRMs), coarse residue and pulp duplicates with each batch (at lea Assays of quality control samples were compared with reference s as acceptable prior to use of data from analysed batches. Laboratory quality control data, including laboratory standards, bla results are captured in the acQuire database and assessed for acc Extended quality control programs including pulp samples submitte with more extensive re-submission programs have been completed Analysis of the available quality control sample assay results indica and precision has been achieved and the database contains no an manipulated.
Verification of sampling and assaying	The assaying techniques and quality control protocols used are co used for reporting exploration drilling results. Sampling intervals defined by the geologist are electronically assig core cutting. Corresponding sample numbers matching pre-labelle interval. All sampling and assay information were stored in a secure acQuir Electronically generated sample submission forms providing the sa each submission to the laboratory. Assay results from the laborato are loaded directly into the acQuire database. Assessment of reported significant assay intervals was verified by and assessment of high resolution core photography. The verificati completed by company personnel and the Competent Person/Qua No adjustments are made to assay data, and no twinned holes hav There are no currently known drilling, sampling, recovery, or other accuracy or reliability of the data.
Location of data points	Drill collar locations were surveyed using a differential GPS with G all drill holes reported. Drill rig alignment was attained using an electronic azimuth aligner intervals in the cover sequence, and every 6 to 30m in diamond dri single shot (Axis Mining Champ Gyro). The single shot surveys hav to surface (Axis Mining Champ) along with a selection of drill holes contactor using a DeviGyro tool - confirming sufficient accuracy for A LIDAR survey was completed over the project area in Nov 2019 topographic model for the project with a spatial accuracy of +/- 0.1r topography is generally low relief to flat, elevation within the dune c Australian Height Datum (AHD) steepening to the southeast. All co Geocentric Datum of Australian (GDA20 Zone 51). All relative dept
Data spacing and distribution	Within the South-East Crescent and Breccia zone drill hole spacing within the initial resource extents. Outside the initial resource boun 200m in lateral extent within the breccia zone over an area of ~2km establish the degree of geological and grade continuity. Significant assay intercepts remain open. Further drilling is require defined mineralisation. No sample compositing is applied to sampl Drilling intersects mineralisation at various angles.

Criteria	Commentary
	Drill holes exploring the extents of the Havieron mineral system int siliclastic sedimentary facies, mineralised breccia and sub-vertical has been interpreted from historic and Newcrest drill holes. Variable brecciation, alteration and sulphide mineralisation is obse 650m x 350m trending in a north west orientation and over 1000m
Orientation of data in relation to geological structure	The subvertical southeast high grade arcuate crescent sulphide zo has been defined over a strike length of up to 550m, and extended cover. Drilling direction is oriented to intersect the steeply dipping high-gra intersection angle of greater than 40 degrees. The drilled length of than true width of mineralisation.
	The security of samples is controlled by tracking samples from drill Drill core was delivered from the drill rig to the Havieron core yard and geotechnical logging, core processing was completed by New High resolution core photography and cutting of drill core was unde facilities.
Sample security	Samples were freighted in sealed bags by air and road to the Labo representatives. Sample numbers are generated directly from the pre-numbered calico bags. Verification of sample numbers and identification is conducted by t sample receipt advise issued to Newcrest. Details of all sample movement are recorded in a database table. analytical suite requested are recorded with the dispatch of sample discrepancies logged at the receipt of samples into the analytical s
	Internal reviews of core handling, sample preparation and assays basis by both project personnel and owner representatives.
Audits or reviews	In the Competent Person's opinion, the sample preparation, securi consistent with current industry standards and are entirely appropr mineralisation identified and will be appropriate for use in the repor Resource estimates. There are no identified drilling, sampling or re adequacy and reliability of the results of the drilling programme in p

Section 2: Reporting of Exploration Results

Criteria	Commentary
	The Havieron Project is entirely contained within mini Greatland Pty Ltd and Newcrest Operations Limited. (effective 30 November 2020) and Farm-In Agreemer Greatland Gold plc. Newcrest is the manager of the H expenditure requirement (US$45 million) and is entitle resulting in an overall joint venture interest of 60%. N acquire a further 5% at fair market value.
Mineral tenement and land tenure status	Newcrest and the Western Desert Lands Aboriginal C Agreement (ILUA) which relates to the use of native t its activities within a 60-km radius around Telfer and i parties have agreed that the ILUA will apply to any fut Participants (Newcrest and Greatland Gold) at Havier The mining tenement M45/1287 wholly replaces the 1 exploration tenement on which the Havieron Project is obligations with respect to legislative requirements inc standing for prior exploration tenement E45/4701.

Criteria	Commentary
Exploration done by other parties	Newcrest completed six core holes in the vicinity of th completed drill targeting and drilling of nine Reverse C approximately 6,800m in 2018. Results of drilling prog been reported on the Greatland Gold website. Drilling has defined an intrusion-related mineral syste sulphide-hosted higher-grade gold-copper mineralisat
Geology	The Havieron Project is located within the north-weste Neoproterozoic Paterson Orogen (formerly Paterson I Supergroup hosts the Havieron prospect and consists and is entirely overlain by approximately 420m of Pha Quaternary aeolian sediments. Gold and copper mineralisation at Havieron consist of and copper mineralisation typical of intrusion-related a hosted by metasedimentary rocks (meta-sandstones, rocks of an undetermined age. The main mineral asse and pyrite sulphide mineral assemblages as breccia a mineralisation event is associated with amphibole-car Drilling has partially defined the extents of mineralisat arcuate shaped mineralised zone, and to depths of up
Drill hole Information	As provided.
Data aggregation methods	Significant assay intercepts are reported as (A) length or equal to 10m, with a maximum of 5m consecutive i exceeding 0.2g/t Au for greater than or equal to 20m, and (C) intervals of >30g/t which are greater or equal applied to intercept calculations.
Relationship between mineralisation widths and intercept lengths	Significant assay intervals reported represent apparen of mineralisation and true widths are less than downh possible when all results are received, and final geolo
Diagrams	As provided.
Balanced reporting	This is the eighteenth release of Exploration Results f dates are 25 July 2019, 10 September 2019, 24 October 2019, 30 April 2020, 11 June 2020, 23 July 2020, 10 Septer January 2021, 11 March 2021, 29 April 2021 , 10 Jun Earlier reporting of exploration programs conducted b reported. Exploration drilling programs are ongoing ar subsequent Newcrest releases.
Other substantive exploration data	Nil
Further work	Growth drilling is planned to extend the December 20 limits of the Havieron mineralised system.

Drillhole data[(1)]

Havieron Project, Paterson Province, Western Australia
Reporting Criteria: Intercepts reported are downhole drill width (not true width) Au >0.20ppm (0.2g/t Au) and minimum 20m downhole width with maximum consecutive internal dilution of 10m. Average grades are based on length-weighting of samples grades. Also highlighted are high grade intervals of Au >1.0ppm (1g/t Au) and minimum 10m downhole width with maximum consecutive internal dilution of 5m, and intervals of >30g/t which are greater or equal to 30 gram metres (Au_ppm x length) are tabled. Gold grades are reported to two significant figures, the downhole lengths are rounded to 0.1m which may cause some apparent discrepancies in interval widths. Samples are from core drilling which is PQ, HQ or NQ in diameter. Core is photographed and logged by the geology team before being cut. Half core PQ, HQ and NQ samples are prepared for assay and the remaining material is retained in the core farm for future reference. Each assay batch is submitted with duplicates and standards to monitor laboratory quality. Total depth (end of hole) is rounded to one decimal place for reporting purposes. Collars denoted with a * show partial results, with further significant assays to be reported in subsequent exploration updates.

#drilling in progress. **partial intercept, assays pending. ^updated intercept. ^^previously reported intercept.

Figure 13. Schematic plan view map showing drill hole locations and significant intercepts reported in this release superimposed on the interpreted geology. Previously reported holes are not shown for the sake of clarity. Note some holes and results appear on multiple sections due to the sections orientation and sections overlap.

To view an enhanced version of Figure 13, please visit:

Forward Looking Statements

This document includes forward looking statements and forward looking information within the meaning of securities laws of applicable jurisdictions. Forward looking statements can generally be identified by the use of words such as "may", "will", "expect", "intend", "plan", "estimate", "anticipate", "believe", "continue", "objectives", "targets", "outlook" and "guidance", or other similar words and may include, without limitation, statements regarding estimated reserves and resources, certain plans, strategies, aspirations and objectives of management, anticipated production, study or construction dates, expected costs, cash flow or production outputs and anticipated productive lives of projects and mines. Newcrest continues to distinguish between outlook and guidance. Guidance statements relate to the current financial year. Outlook statements relate to years subsequent to the current financial year.

These forward looking statements involve known and unknown risks, uncertainties and other factors that may cause Newcrest's actual results, performance and achievements or industry results to differ materially from any future results, performance or achievements, or industry results, expressed or implied by these forward-looking statements. Relevant factors may include, but are not limited to, changes in commodity prices, foreign exchange fluctuations and general economic conditions, increased costs and demand for production inputs, the speculative nature of exploration and project development, including the risks of obtaining necessary licences and permits and diminishing quantities or grades of reserves, political and social risks, changes to the regulatory framework within which Newcrest operates or may in the future operate, environmental conditions including extreme weather conditions, recruitment and retention of personnel, industrial relations issues and litigation. For further information as to the risks which may impact on Newcrest's results and performance, please see the risk factors included in the Annual Information Form dated 13 October 2020 lodged with ASX and SEDAR.

Forward looking statements are based on Newcrest's good faith assumptions as to the financial, market, regulatory and other relevant environments that will exist and affect Newcrest's business and operations in the future. Newcrest does not give any assurance that the assumptions will prove to be correct. There may be other factors that could cause actual results or events not to be as anticipated, and many events are beyond the reasonable control of Newcrest. Readers are cautioned not to place undue reliance on forward looking statements, particularly in the current economic climate with the significant volatility, uncertainty and disruption caused by the COVID-19 pandemic. Forward looking statements in this document speak only at the date of issue. Except as required by applicable laws or regulations, Newcrest does not undertake any obligation to publicly update or revise any of the forward looking statements or to advise of any change in assumptions on which any such statement is based.

Ore Reserves and Mineral Resources Reporting Requirements

As an Australian Company with securities listed on the Australian Securities Exchange (ASX), Newcrest is subject to Australian disclosure requirements and standards, including the requirements of the Corporations Act 2001 and the ASX. Investors should note that it is a requirement of the ASX listing rules that the

reporting of ore reserves and mineral resources in Australia is in accordance with the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the JORC Code) and that Newcrest's ore reserve and mineral resource estimates comply with the JORC Code.

Newcrest is also subject to certain Canadian disclosure requirements and standards, as a result of its secondary listing on the Toronto Stock Exchange (TSX), including the requirements of National Instrument 43-101 (NI 43-101). Investors should note that it is a requirement of Canadian securities law that the reporting of Mineral Reserves and Mineral Resources in Canada and the disclosure of scientific and technical information concerning a mineral project on a property material to Newcrest comply with NI 43-101. Newcrest's material properties are currently Cadia, Lihir and Wafi-Golpu.

Competent Person's Statement

The information in this document that relates to Exploration Targets, Exploration Results, and related scientific and technical information, is based on and fairly represents information compiled by Mr F. MacCorquodale. Mr MacCorquodale is the General Manager - Greenfields Exploration and a full-time employee of Newcrest Mining Ltd.. He is a shareholder in Newcrest Mining Ltd. and is entitled to participate in Newcrest's executive equity long term incentive plan, details of which are included in Newcrest's 2020 Remuneration Report. He is a Member of the Australian Institute of Geoscientists. Mr MacCorquodale has sufficient experience which is relevant to the styles of mineralisation and types of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the JORC Code and as a Qualified Person under NI 43-101. Mr MacCorquodale approves the disclosure of scientific and technical information contained in this document and consents to the inclusion of material of the matters based on his information in the form and context in which it appears.
