

# Alphamin Announces Successful Infill Drilling At Mpama South With Increase In Both Resource Confidence And Mineral Resources

10.02.2023 | [GlobeNewswire](#)

Grand Baie, Feb. 10, 2023 - [Alphamin Resources Corp.](#) (AFM:TSXV, APH:JSE AltX, "Alphamin" or the "Company"), a producer of 4% of the world's mined tin<sup>1</sup> from its high-grade operation in the Democratic Republic of Congo, is pleased to announce completion of the infill drilling campaign at Mpama South and an updated Mineral Resource Estimate (MRE) for Mpama South.

## HIGHLIGHTS

- Substantially improved the confidence of Mineral Resources at Mpama South whilst extending the known mineralisation boundary.
- Increased Indicated Resources by 286% to 3.26Mt based on assays from 63 additional infill and extensional drillholes.
- Mpama South Mineral Resources now stand at:
  - 3.26Mt @ 2.46% Sn for 80.2kt contained tin in the Indicated category; and
- 2.84Mt @ 2.42% Sn for 68.7kt contained tin in the Inferred category.
- Significant additional resource growth potential at Mpama South as the deposit still remains open down-dip.
- Mpama South Mine construction works progressing according to plan - project completion expected to increase Alphamin's annual contained tin production from the current 12,000tpa to ~20,000tpa, approximating 6.6% of the world's mined tin<sup>1</sup>.

## Mpama South Updated Mineral Resource Estimate

In just 24 months, Alphamin has:

- delivered a top-10 globally significant CRIRSCO compliant tin deposit by contained tin<sup>1</sup> at Mpama South;
- grown the resources to ~2.2 times versus the Maiden Mineral Resources and PEA<sup>2</sup> numbers;
- increased resource confidence across the deposit; and
- commenced mine construction through own cashflows.

This brings forward an additional planned ~7,200tpa contained tin production, which will make Alphamin one of the largest tin producers globally and delivers on the Company strategy of organic growth and creating shareholder value.

The updated Mineral Resource for Mpama South follows eight months after the previous update announced on 31 May 2022. The update is based on receipt of assays for another 63 infill and extensional drillholes completed subsequent to the previous estimate which was based on 124 drillholes. The updated Mineral Resource is presented in Figure 1 along with the direction in which mineralisation is still open down dip and significant high grade periphery drilling intercepts.

The updated MRE now includes results from 187 drillholes at Mpama South as well as 6 drillholes drilled in 2015 in the area between Mpama South and the Mpama North ore body. The MRE was estimated using the Canadian Institute of Mining, Metallurgy and Petroleum (CIM) Best Practice Guidelines (2019) and is reported in accordance with the 2014 CIM Definition Standards.

Figure 1: Updated Mpama South Mineral Resource 07 February 2023 with selected intercepts and direction in which mineralisation is still open

Source: Alphamin 2022

The Mineral Resource is classified into the Indicated and Inferred categories and is reported at a base case tin cut-off grade of 1.0%, which satisfies reasonable prospects for economic extraction. Mpama South Indicated Resources increased by ~286% to 3.26Mt by converting Inferred Resources, while Inferred Resources grew nominally by ~275kt (excluding those tonnes converted to Indicated). The Mineral Resource Estimate, which is effective as of 07 February 2023, is presented in Table 1 below:

Table 1: Updated Mpama South Mineral Resources effective date 07 February 2023

Classification	Tonnes (millions)	Sn %	Sn Tonnes (thousands)
Indicated <sup>3</sup>	3.26	2.46	80.2
Inferred <sup>4</sup>	2.84	2.42	68.7

Mineral Resources that are not Mineral Reserves do not have a demonstrated economic viability and require advanced studies and economic analysis to prove their viability for extraction.

Extensional drilling down-dip and in the shallower northern and southern portions of Mpama South can be conducted at the Company's election to carry on extending known mineralisation at Mpama South, which is still open in multiple directions. High grade drillholes around the peripheries where mineralisation remains open are highlighted in Figure 1, showing the remaining prospectivity for Resource expansion. However, for 2023, the focus will primarily be aimed at the Mpama South Mine construction and commissioning efforts, while exploration drilling will be curtailed, instead, focusing on further field work campaigns to support future programs.

The MRE has been completed by Mr. J.C. Witley (BSc Hons, MSc (Eng.)) who is a geologist with 34 years' experience in base and precious metals exploration and mining as well as Mineral Resource evaluation and reporting. He is a Principal Resource Consultant for The MSA Group (an independent consulting company), is registered with the South African Council for Natural Scientific Professions (SACNASP) and is a Fellow of the Geological Society of South Africa (GSSA). Mr. Witley has the appropriate relevant qualifications and experience to be considered a "Qualified Person" for the style and type of mineralisation and activity being undertaken as defined in National Instrument 43-101 *Standards of Disclosure of Mineral Projects*.

#### Bisie Ridge Regional Exploration Update

Alphamin intensified exploration drilling on the 13km long Bisie Ridge from Q3 2022 to test highly anomalous soil, geophysical and structural targets identified during 2021. 8,773 metres of the 10,000 metre Phase 1 diamond core programme have been completed along the Ridge, with the remainder due for completion in Q1 2023.

Although anomalous mineralisation has been confirmed in drilling on the Ridge, it is not of the obvious coarse visual cassiterite type frequently seen in drillcore from Mpama North and South.

Only ~25% of assays have been returned from the independent laboratory to date from the Ridge drilling. Assay results when received will support a fuller investigation into the regional setting, along with data from the on-going geophysical downhole surveys, structural investigations and mapping, thereby enabling a refocused exploration programme. Until then, the key focus at site remains the construction and commissioning of the new Mpama South Mine.

#### Qualified Persons

Mr Jeremy Witley, Pr. Sci. Nat., B.Sc. (Hons.) Mining Geology, M.Sc. (Eng.), is a qualified person (QP) as defined in National Instrument 43-101 and has reviewed and approved the scientific and technical information contained in this news release. He is a Principal Mineral Resource Consultant of The MSA Group

(Pty.) Ltd., an independent technical consultant to the Company.

#### CAUTION REGARDING FORWARD LOOKING STATEMENTS

*Information in this news release that is not a statement of historical fact constitutes forward-looking information. Forward-looking statements contained herein include, without limitation, statements relating to the anticipated future exploration and resource estimation activities and outcomes and the timing thereof and*

*expected increases in tin production from the development of the Mpama South deposit and the cost and timing of such development activities. Forward-looking statements are based on assumptions management believes to be reasonable at the time such statements are made. There can be no assurance that such statements will prove to be accurate, as actual results and future events could differ materially from those anticipated in such statements. Accordingly, readers should not place undue reliance on forward-looking statements. Although Alphamin has attempted to identify important factors that could cause actual results to differ materially from those contained in forward-looking statements, there may be other factors that cause results not to be as anticipated, estimated or intended. Factors that may cause actual results to differ materially from expected results described in forward-looking statements include, but are not limited to: uncertainty of future exploration and assay results and consistency with past results and expectations; uncertainties related to the technical and economic parameters applied in the Mpama South Preliminary Economic Assessment regarding forecasted tin prices, the tin grade mined and processing recoveries as well as operating costs; uncertainties inherent in estimates of Mineral Resources, global geopolitical and economic uncertainties, volatility of metal prices, uncertainties with respect to social, community and environmental impacts, uninterrupted access to required infrastructure, adverse political events, impacts of the global Covid-19 pandemic as well as those risk factors set out in the Company's Management Discussion and Analysis and other disclosure documents available under the Company's profile at [www.sedar.com](http://www.sedar.com). Forward-looking statements contained herein are made as of the date of this news release and Alphamin disclaims any obligation to update any forward-looking statements, whether as a result of new information, future events or results or otherwise, except as required by applicable securities laws.*

*Neither the TSX Venture Exchange nor its regulation services provider (as that term is defined in the policies of the TSX Venture Exchange) accepts responsibility for the adequacy or accuracy of this news release.*

#### Appendix 1: SAMPLE PREPARATION, ANALYSES AND QUALITY CONTROL AND QUALITY ASSURANCE (QAQC)

For sample preparation, analyses and quality control and quality assurance, see the Company's news release dated 07 March 2022 entitled "ALPHAMIN ANNOUNCES MAIDEN MINERAL RESOURCE ESTIMATE AND POSITIVE PRELIMINARY ECONOMIC ASSESSMENT FOR MPAMA SOUTH"

### Appendix 3: Checklist of Assessment and Reporting Criteria

Drilling techniques	All drillholes were diamond drill cored and drilled from surface (most inters
Logging	All of the drillholes were geologically logged by qualified geologists. The lo
Drill sample recovery	Core recovery in the mineralised zones was observed to be very good and Half core samples were collected continuously through the mineralised zon
Sampling methods	

At the on-site ABM laboratory (managed by Anchem), samples were first checked off against the list of received samples at ALS Johannesburg. Received samples at ALS Johannesburg are checked off against the list of samples received. Prior to the 2021 drilling the assays were also conducted at ALS Global in Johannesburg. The assay method used for ME-ICP61, HF, HNO<sub>3</sub>, HCL04 and HCL leach with ICP-AES finish was used. External quality assurance of the laboratory assays for the Alphamin samples was conducted by ALS.

The QAQC measures used by Alphamin revealed the following:

- Blank samples indicated that no significant contamination occurred on the samples.
- Five different CRMs were used with expected values between 0.18% and 0.22%.
- Coarse duplicates show mostly excellent correlation, indicating minimal bias.

#### Quality of assay data and laboratory tests

The mineralisation in thirteen of the drillholes completed in 2021 at Mpama South was verified. 105 pulp duplicates were sent to SGS (Johannesburg) in November 2021 for verification.

#### Verification of sampling and assaying

- The pulp duplicates showed acceptable correlation with the ALS assays.
  - Average bias for grade ranges > 1% is less than 1%.
  - Tendency for ALS to be higher (~5%) for the grade ranges less than 1%.
- Inter-lab precision (after removal of <0.10%) is 85% within 10% error.

#### Location of data points

The drillhole collar positions were surveyed using a differential GPS.

Downhole surveys were completed using a multishot down-hole survey instrument.

#### Tonnage factors (in situ bulk densities)

Relative density measurements were made on the majority of recent drillholes.

#### Data density and distribution

A total of 124 holes were drilled in Mpama South. An additional 6 holes were drilled in Mpama North.

#### Database integrity

Data was provided as Excel files. MSA completed spot checks on the data.

	The mineralisation consists of seven zones, with a total extent of 950 m along the strike.
Dimensions	<p>The mineralised intersections are clearly discernible in drill core. The Mineral Resource is divided into seven zones (MZ1 to MZ7). MZ1 is the largest zone by volume of the Mineral Resource, with an extent of 300 m along the strike. Three smaller zones (MZ3 to MZ5) occur in the footwall of the main zones. A narrow zone (MZ7) occurs in the hangingwall of the main mineralisation. MZ6, which occurs to the south, tends to be lower in grade and has an average tin grade of 0.22%. A three-dimensional wireframe model was created for the seven zones of mineralisation.</p>
Geological interpretation	
Domains	The mineralisation was modelled as seven tabular zones containing irregularly shaped mineralised intersections.
Compositing	Sample lengths were composited to 1 m by length and density weighting. Statistics for the seven estimation domains show distributions that are positively skewed. The two main zones (MZ1 and MZ2) have similar average tin grades (2.22% and 2.21% respectively).
Statistics and variography	Normal Scores semivariograms were calculated in the plane of the mineralisation. The variograms show that the mineralisation is highly heterogeneous and that the grade variability is high.
Top or bottom cuts for grades	Top caps were applied to outlier values, identified as breaks in the cumulative distribution function. Data clustering occurs where the fan drilling, collared on the western side of the main mineralisation.
Data clustering	
Block size	A rotated block model with a parent cell of 10 mX by 10 mY by 2 mZ was used for the estimation. The block size was determined based on the variogram and the search volume.
Grade estimation	Tin, copper, lead, zinc, silver, arsenic and density were estimated using ordinary kriging. Estimation was carried out in three passes, with the first pass using search volumes of 10 m by 10 m by 2 m. Dynamic Anisotropy was used to orientate the search volumes to the strike-slip fault.

	Indicated Mineral Resources were declared where the drillhole spacing is a

<sup>1</sup> Based on data obtained from International Tin Association Tin Industry Review 2022

<sup>2</sup> See News Announcement 7 March 2022 for Preliminary Economic Assessment and Resources

<sup>3</sup> CIM Definition: An Indicated Mineral Resource is that part of a Mineral Resource for which quantity, grade or quality, densities, shape and physical characteristics are estimated with sufficient confidence to allow the application of Modifying Factors insufficient detail to support mine planning and evaluation of the economic viability of the deposit.

<sup>4</sup> CIM Definition: An Inferred Mineral Resource is that part of a Mineral Resource for which quantity and grade or quality are estimated on the basis of limited geological evidence and sampling. Geological evidence is sufficient to imply but not verify geological and grade or quality continuity.
