

# Genius Metals to Assess the Lithium Potential of the Paka Property as part of its 2023 Summer Exploration Campaign

12.07.2023 | [CNW](#)

MONTRÉAL, July 12, 2023 - [Genius Metals Inc.](#) (TSXV: GENI) ("Genius Metals" or the "Company") is pleased to announce the imminent property-wide prospection campaign on its recently acquired Paka property located approximately 8 kilometers SE of the Corvette property owned by Patriot Battery Metals (TSXV:PMET).

## 2023 Exploration Campaign

The exploration follows the Company's intent to assess the lithium potential of the Sakami and Iserhoff properties (see Genius' press release dated June 14, 2023). The Paka prospecting campaign will identify and sample lithium-bearing pegmatites as soon as the current restrictions related to forest fires are lifted. The database from the Ministère des Ressources Naturelles du Québec has identified several granitic outcrops, often pegmatitic on the Paka property and the surrounding areas. Those outcrops will be investigated by the Company as priority targets. The property has received limited exploration; only two assayed samples were reported from the property.

## About the Paka Property

On June 27, 2023, the Company announced that it had completed the acquisition of 100% interest in the Paka lithium property located approximately 8 kilometers SE of the Corvette property owned by Patriot Battery Metals (TSXV:PMET). The property is made of 189 contiguous claims covering more than 97 km<sup>2</sup> and is located in the Archean La Grande greenstone belt where recent discoveries of lithium mineralization (i.e., Cancet, Corvette, Adina, James Bay and Wabouchi) attest to the high lithium potential of the region (figure 1). The Paka property is surrounded by numerous biotite-muscovite granitic plutons which are commonly associated with LCT (lithium-cesium-tantalum) granitic pegmatite dykes. There are major structural breaks on the property and the surrounding areas which constitute pathways for the intrusion of late-stage granites and granitic pegmatites with high lithium potential. The vegetal cover is sparse and the claim ground is covered by glacial till and lacustrine sediments. There are numerous small lakes and bogs and the density of outcrops is poor to moderate.

On July 7, 2023, the Company has received the formal approbation from the TSX Venture Exchange for the acquisition of the Paka property.

\*Genius Metals cautions that mineralization hosted on adjacent or nearby properties is not necessarily indicative of the mineralization hosted on its properties.
