

Q Battery Metals Expands Targeted Sampling of Pegmatite At La Corne South Lithium Project, Quebec

14.08.2023 | [ACCESS Newswire](#)

VANCOUVER, August 14, 2023 - [Q Battery Metals Corp.](#) ("Q Battery Metals" or the "Company") (CSE:QMET)(OTC:BTKRF)(FRA:ONB) is pleased to announce an expanded sampling exploration program on the La Corne South project, located north of Val d'Or, Quebec. During the previous exploration program, the geologic team mapped and sampled several narrow pegmatitic bodies within bedrock and several larger float blocks of pegmatitic material (see news release dated July 3, 2023). Samples were collected from these exposures and were submitted to the ALS laboratory for multi-element analysis including lithium.

The Q Battery Metals team have been targeting areas where prior sampling returned elevated lithium values from work programs completed in 2021. The 2023 reconnaissance work is guided by Dr. Mathieu Piché, a director and OGQ Geoscientist for Q Battery Metals. The geologic team will continue mapping and sampling pegmatite outcrops in the primary area of interest. The team also plans to prospect zones targeted for pegmatites from the previously completed high-detail magnetics survey. From the work conducted so far, interpretations indicate a cluster of pegmatite veins and dykes associated with topographic ridges within the targeted area of the property.

The intention of 2023 exploration on the La Corne South project is to identify lithium-bearing pegmatites that can be diamond drilled this coming fall and winter.

The La Corne South Property is located over the southern portion of the La Corne Batholith. At least 14 lithium projects are associated with the margins of the La Corne Batholith within 20 kilometres of the QMET claims. Sections of the batholith are pegmatitic which host the lithium. Within 10 kms, the North American Lithium project is a historic lithium mine that now lists proven and probable mineral reserves estimated at 29.2 million tonnes (Mt), grading 0.96% Li₂O, with contained Li₂O of 280,300t. As well, the potential for VMS deposition containing Cu-Zn-Ag is evident on the La Corne South claims.

Q Battery Metals exploration programs undertaken in Quebec are supervised by Dr. Mathieu Piché, OGQ, with office located north of Val d'Or. He is also a Q Battery Metals company director. The company has 100% interest in mineral claims within Quebec and British Columbia, with exploration targeting critical and precious metals.

Perry Grunenberg, P.Geo, a "Qualified Person" as that term is defined under NI 43-101, has reviewed and approved the technical information in this news release.

Cautionary Statement

This press release contains forward-looking statements based on assumptions as of that date. These statements reflect management's current estimates, beliefs, intentions and expectations; they are not guarantees of future performance. The Company cautions that all forward-looking statements are inherently uncertain and that actual performance may be affected by a number of material factors, many of which are beyond the Company's control. Such factors include, among other things: risks and uncertainties relating to exploration and development; the ability of the Company to obtain additional financing; the Company's limited operating history; the need to comply with environmental and governmental regulations; fluctuations in the prices of commodities; operating hazards and risks; competition and other risks and uncertainties, including those described in the Company's Prospectus dated September 8, 2017 available on www.sedar.com. Accordingly, actual and future events, conditions, and results may differ materially from the estimates, beliefs, intentions, and expectations expressed or implied in the forward-looking information. Except as required under applicable securities legislation, the Company undertakes no obligation to publicly

update or revise forward-looking information.
