

Cohiba Minerals Limited: Exploration update - Canadian Prospects

26.10.2023 | [ABN Newswire](#)

Melbourne, Australia - [Cohiba Minerals Ltd.](#) (ASX:CHK) (OTCMKTS:CHKMF) is pleased to provide a brief update to the market in relation to the current reconnaissance work on its lithium and rare earth elements prospects in Ontario, Canada.

Highlights:

- Reconnaissance work completed over the Gathering Lake, Rogers Creek and Ottertail prospects.
- Multiple large-scale pegmatites identified, mapped and sampled.

Cohiba's CEO, Andrew Graham says, "We are pleased to announce that Dahrouge Consulting has completed the initial reconnaissance work on each of the Gathering Lake, Rogers Creek and Ottertail prospects in Ontario, Canada. Access to the Big Rock prospect was hampered due to a decommissioned bridge and field conditions, and as such work on this prospect was postponed with additional work being allocated to the other prospects. The field program commenced on 21 September 2023 at Gathering Lake and concluded on 7 October 2023 at the Ottertail prospect.

"Multiple large pegmatites were identified and mapped, and samples were collected for analysis via a commercial laboratory. These result will be reported in due course."

Gathering Lake

Reconnaissance work at Gathering Lake (Figure 1*) commenced on 21 September 2023 and comprised field mapping and outcrop sampling. Numerous pegmatites were identified within both meta-sedimentary units (Figure 2*) and granitic bodies (Figures 3 and 4*), and were sampled for analysis by a commercial laboratory.

Tourmaline crystals were observed in some of the pegmatites. Tourmaline can provide evidence for the compositional evolution of pegmatite-forming melts through magmatic crystallization and pegmatite melt - host-rock interactions, and as such may be an important indicator mineral.

Rogers Creek

Reconnaissance work at Rogers Creek (Figure 5*) commenced on 28 September 2023 and comprised field mapping and outcrop sampling. Numerous pegmatites were identified primarily within meta-sedimentary units (Figure 6*) and were sampled for analysis by a commercial laboratory. Apatite and possibly beryl crystals were observed (Figure 7*) in the pegmatites in the north-eastern part of the prospect and comprised up to 1% (visual assessment). Tourmaline crystals were also observed in some of the pegmatites.

Ottertail

Reconnaissance work at Ottertail (Figure 8*) commenced on 3 October 2023 and comprised field mapping and outcrop sampling. Numerous granitic pegmatite dykes within a zone comprising a para-gneissic unit (Figures 9 and 10*) were identified and were sampled for analysis by a commercial laboratory. Many of the pegmatites in the eastern part of the Ottertail prospect contained epidote altered feldspar.
