

Renforth Resources's Fouillac Confirmed as Third Critical Minerals Location within Malartic Metals Package, Parbec Permits Received

14.08.2025 | [The Newswire](#)

[Renforth Resources Inc.](#) (CSE: RFR) (OTC: RFHRF) (FSE: 9RR) ("Renforth" or the "Company"), is pleased to provide shareholders with an update on our ~300 km² Malartic Metals Package (the "MMP"), which hosts the Victoria, Lalonde and Fouillac nickel rich polymetallic mineralization, along with a copper discovery at Beaupré and documented historic gold occurrences¹.

Fouillac Confirmed Polymetallic Occurrence

Earlier this summer a prospecting program consisting of 50 grab and channel samples was focussed on Fouillac, with 25 of the 50 samples taken. The program successfully confirmed the presence of the same style of mineralization on surface as is seen at Victoria and Lalonde, with surface sampling stretching over ~550m, limited by a lack of outcrop. Grab sampling in this area returned several interesting results, including a highlight nickel value of 1080ppm visibly associated with disseminated sulphides and copper values exceeding the Quebec significant threshold of 125ppm for a copper anomaly. Please note grab sampling is selective in nature and results are not representative of more than the sample itself. These early stage prospecting results confirm that Fouillac, while the least explored of the 3 polymetallic occurrences within the MMP, merits additional work and integration into future planning for critical minerals at the MMP.

Victoria Maiden Resource Modelling Commenced

Renforth would like to advise shareholders that modelling of a maiden resource within the 2.5km of drilled strike on the ~20km long Victoria polymetallic structure has commenced, it is anticipated a maiden resource will be delivered this fall.

"Confirmation of mineralization at Fouillac is an accretive event at MMP. A third location of the polymetallic (Ni/Co/PGM+Zn/Cu/Ag/Au) mineralization, again on surface and with road access, demonstrates additional value and potential, especially if one is to consider a future "hub and spoke" scenario. In the future there is a possibility that the MMP could host a processing facility fed with material from the ~20km long Victoria mineralized system, the similar length and mineralized Lalonde system 4km to the north of Victoria, and the Fouillac occurrence, a similar distance to the south of Victoria. That is the future, first we are excited to pursue an initial maiden resource over our initial 2.5km of drilling at Victoria this year" states Ms. Nicole Brewster, President and CEO of Renforth.

Sample results referred to in this press release were obtained from samples selected in the field, bagged and tagged and securely delivered to the facilities of ALS Canada Ltd. where they were tested using ME-MS41 Ultra Trace ICP-MS analysis with Aqua Regia digestion.

Parbec Permits Received

Renforth has received, earlier than anticipated, the permits required to strip an area of our Parbec gold deposit which includes the "Diorite Splay", in order to expose bedrock currently covered by thin overburden. Renforth will proceed to chip and remove overburden from the site on the south side of the Cadillac Break, over a portion of the recently modelled Parbec gold deposit, later this fall. This will enable mapping and sampling, as well as professional surveying of known, and any newly uncovered, surface gold mineralization

in order to bring the modelled gold deposit to surface, no positive surface data was used in the calculation of the 2025 MRE for Parbec.

Director Resignation

Renforth would like to inform shareholders that, due to international travel and time obligations associated with a new business venture Ms. Judi Wood has tendered her resignation from the Company. Ms. Wood made meaningful contribution to the affairs of the Board of the Company and will be missed, best wishes are offered in the success of the new venture.

Martin Demers P.Geo OGQ 770, Vice President of Exploration for Renforth and a qualified person pursuant to the guidelines in NI 43-101, has reviewed and approved the geological information contained in this press release.

1 Gold documented as occurring within the MMP property boundaries in the SIGEOM database in several historic drillholes and campaigns in the central/north central part of the property, as well as in Renforth's own work within the Victoria polymetallic system.
