Morocco Strategic Minerals Reports Initial Sampling Results from the Tifernine Property

21.08.2025 | GlobeNewswire

MONTRÉAL, Aug. 21, 2025 -- Morocco Strategic Minerals Corp. (TSXV: MCC) ("Morocco Strategic Minerals" or the "Corporation") is pleased to announce results from its July 2025 channel and grab sampling program on the Tifernine Property, located southeast of Ouarzazate in the Kingdom of Morocco, where the Corporation holds an option to acquire a 100% interest.

Sampling Program Overview

The Tifernine property covers approximately 16 km² and hosts several significant sub-vertical mineralized structures situated in the northeastern portion of the permit.

- Structure ST1, the most extensive, is exposed over 600 metres of strike and reaches up to 11 metres in width.
- Structures ST2 and ST3, located nearby, extend over 100 metres and 110 metres respectively, with widths of up to 2 metres.

A total of 14 channel samples (76 individual samples, excluding QA/QC blanks, standards, and duplicates) were collected along ST1, with each channel representing a 1-metre interval across mineralized zones. In addition, five grab samples* were collected from ST2 and ST3. All samples were analyzed at Afrilab Laboratory in Marrakech, Morocco.

Note: Grab samples are selective by nature and may not be representative of overall mineralization or true metal content.

Figure 1: Location of mineralized structures with channel samples (Tif-01 to Tif-14) and grab samples (Tif-15 to Tif-19) on the Tifernine property.

A total of 14 channels (76 samples in total, excluding QA/QC blanks, standards, and duplicates) were collected along the mineralized structure ST1. The channels were taken directly on the mineralized zone, with each sample representing a 1-meter interval. From structure 2 and 3 (ST2 and ST3) a total of 5 grab samples* were collected. All these samples were sent and analyzed at Afrilab Laboratory in Marrakech, Morocco

**Surface grab samples are selective by nature and are not necessarily representative of the overall mineralization or the true metal content (copper, gold, or silver) of the underlying rock.*

Highlights from the sampling program include:

- 5 channel samples grading above 1.00% Cu, with a peak value of 2.30% Cu.
- 3 channel samples grading above 1.00% CuOX, with a maximum of 1.72% CuOX.
- 3 grab samples returning copper grades above 0.50% Cu, including 1.89% Cu (sample Tif-16, ST3).
- 42 samples above detection limit for gold (>0.05 g/t Au), with a maximum of 0.30 g/t Au (sample Tif-16).
- 13 samples with zinc values above 0.50% Zn, including a maximum of 17.75% Zn (sample Tif-07).

(See Table 1 for average channel results.)

Samples	length (m)	Au* (g/t)	Ag *(ppm)	Cu *(ppm)	CuOX (ppm)	Pb *(ppm)	Zn *(ppm)
Tif-01	2	0,025	2,81	446	306	683	314
Tif-02	3	0,119	3,61	923	489	459	6193
Tif-03	3	0,078	1,75	276	176	398	4829
Tif-04	4	0,025	1,03	123	58	154	137
Tif-05	5	0,086	2,50	582	362	558	535
Tif-06	5	0,097	1,19	2288	1166	182	596
Tif-07	8	0,077	2,81	3135	1911	555	26449
Tif-08	8	0,088	1,87	2618	1463	339	2867
Tif-09	11	0,070	1,80	5644	3946	240	1013
Tif-10	10	0,090	1,67	4144	2274	767	705
Tif-11	2	0,121	6,42	2753	1543	2511	3450
Tif-12	4	0,076	5,02	3620	476	2878	9566
Tif-13	5	0,046	2,35	1368	636	134	2111
Tif-14	6	0,061	0,86	1349	584	59	1722

Table 1: Average results obtained from channel samples.

"The results confirm the presence of high-grade copper mineralization within exposed structures and outline significant copper anomalies," stated Pierre-Olivier Goulet, Vice President of Corporate Development. "At Tifernine, mineralization is structurally controlled within veins and shear zones, with widths reaching up to 11 metres. Anomalous gold values highlight the property's untapped gold potential, while the strong zinc grades reinforce its polymetallic character. Collectively, these results underscore the potential scale and upside of Tifernine."

The Company is currently designing a follow-up exploration program that will include detailed geological mapping and trenching to evaluate the continuity of mineralization and to generate additional targets across the Tifernine property.

About the Tifernine Copper Property

The Tifernine Copper Project covers an area of approximately 16 km² and is located southeast of Ouarzazate, Morocco, accessible via the national road N9, which connects Ouarzazate to Zagora. The property is situated just 10 km from the BMR property, where Morocco Strategic Minerals also holds an option to acquire a 100% interest (see press release dated July 11, 2024).

Geologically, the Tifernine property consists of an Ediacaran rhyolitic and andesitic complex intersected by ENE-WSW-oriented faults. It hosts several sub-vertical structures, each extending approximately 600 m in length and up to 11 meters in width. These structures are locally brecciated and contain quartz-carbonate veins. Copper mineralization is observed both in veins and disseminated within the volcanic rocks.

About Morocco Strategic Minerals Corporation

Morocco Strategic Minerals Corp. is a Canadian mineral exploration company focused on the acquisition, exploration, and, if warranted, development of natural resource properties of merit in Canada and Morocco.

Qualified Person

The technical and scientific information in this press release have been reviewed by Merouane Rachidi, Ph.D., P.Geo., an independent qualified person as defined in National Instrument 43-101 - Standards of Disclosure for Mineral Projects ("NI 43-101").

Sample Analysis Method

Samples were prepared by African Laboratory for Mining and Environment ("Afrilab") in Marrakech, Morocco. All samples were analyzed for silver, copper, oxide copper (CuOX), iron, lead, and zinc using Aqua regia and finished by atomic absorption spectroscopy ("AAS"). Samples with above 5% Cu content were reanalyzed using titration method.

Gold is assayed by fire assaying. Standards and blanks were inserted every 30 samples in addition to the standards, blanks and pulp duplicate inserted by Afrilab.
