

Soma Gold Announces The Commencement Of Drilling On Psyche 2 Copper Anomaly

23.12.2025 | [CNW](#)

[Soma Gold Corp.](#) (TSXV: SOMA) (WKN: A2P4DU) (OTC: SMAGF) (the "Company" or "Soma") is pleased to announce that the Colombian government has issued drill permits for the copper anomaly in the Psyche 2 target area of the Machuca Project in Antioquia, Colombia (Figure 1). A large survey completed in 2025 identified a significant copper anomaly coincident with a prominent magnetic high at the Psyche 2 target area (see news release dated May 6, 2025). A drill rig has been mobilized to the first drill pad at the northern end of the Copper Anomaly.

Figure 2 displays a log-normal index value, combining Cu-Au-Zn-Ni-Co-Mn values, superimposed on the first vertical cross-section map. The greater than 95th percentile index values are clustered along the western edge of the soil grid, forming a north-south trending anomaly with a strike length of approximately 4.5 kilometres. This anomaly is located near the Otú Fault and is thought to be controlled by associated higher-order structures. The anomalous soil samples also coincide with a prominent magnetic high and a distinct radiometric low (Figures 2 and 3). The cause of the geophysical anomalies is currently unknown due to limited exposure along the length of the anomaly. Geological mapping is underway along the entire length of the anomaly to determine the nature of the underlying bedrock. However, fresh drill core will be critical to resolving the cause of the Copper Anomaly.

The depth extent of the magnetic anomaly underlying the copper anomaly has been constrained by a 3D inversion completed by Convolutions Geoscience (Figure 4). The magnetic anomaly appears to be fault-bounded along its eastern and western margins and extends to depth. Soil anomalies directly overlie the subcrop extent of the body that forms the magnetic anomaly. Phase 1 drill program is designed to determine the source of the magnetic and radiometric anomalies in this area.

Phase 1 drilling will target a cluster of soil samples at the northern end of the copper anomaly. Samples in this area contain some of the most anomalous values of the six index elements within the broader anomaly (see Figures 2 and 3). Phase 1 will include four to five drill holes on the first drill pad for a total of approximately 2,000 m of drilling.

Chris Buchanan, Soma's Vice President of Exploration, stated, "We are happy to be able to start drilling on the Copper Anomaly before the end of the year. The cause of the anomaly has been the centre of debate on the exploration team, and fresh drill core will help determine the style and tenor of mineralization and the type of host rock in the core of the magnetic anomaly. The results of Phase 1 drilling will determine our approach to the remainder of the 4.5 km strike length of the copper anomaly."

Soil sampling has also successfully identified numerous gold anomalies at the Psyche 2 target. The extent and tenor of these anomalies represent an exciting new exploration target in the region. Drilling will continue in 2026 at the high-grade gold target at the Colossa Mine and the Aurum-Orion-Eros area. Soil sampling on the Machuca Project will focus on extending the Psyche 2 grid to the southeast. Airborne geophysics identified another area with coincident magnetic high-radiometric low anomalies southeast of the Psyche 1 grid that were not tested by the 2024 soil sampling program. Additionally, the Company continues its ESG programs across the property packages and continues to consult with local communities regarding the ongoing exploration activities.

The Otú fault system ("Otú Fault") extends for over 100 km, from Segovia-Remedios in the south to Nechi in the north, and is buried beneath younger sedimentary overlap sequences. Soma's tenements now cover more than 56 km of this strike-slip fault. High-grade gold deposits have been identified along the entire length of the Otú Fault, hosted in brittle-ductile to brittle fault zones formed during later deformation stages. Throughout the district, quartz veins show orientation patterns consistent with conjugate faults associated with brittle faulting along the Otú Fault. Notable mines along this trend include Segovia-Remedios, Aurora, El Limon, Le Ye, Los Mangos, and Cordero. The Machuca Property is located along a key segment of this regional fault system and shows numerous signs of high-grade gold mineralization.

Qualified Person Statement

Mr. Chris Buchanan, P.Geol., is Soma's Vice-President of Exploration and a Qualified Person as defined by National Instrument 43-101. Mr. Buchanan has reviewed and approved the technical information disclosed in this press release.

ABOUT SOMA GOLD

Soma Gold Corp. (TSXV: SOMA) is a mining company focused on gold production and exploration. The Company owns two adjacent mining properties in Antioquia, Colombia with a combined milling capacity of 675 tpd. (Permitted for 1,400 tpd). The El Bagre Mill is currently operating and producing. Internally generated funds are being used to finance a regional exploration program.

With a solid commitment to sustainability and community engagement, Soma Gold Corp. is dedicated to achieving excellence in all aspects of its operations.

The Company also owns an exploration property near Tucuma, Para State, Brazil that is currently under option to [Ero Copper Corp.](#)

On behalf of the Board of Directors

"Geoff Hampson"
Chief Executive Officer and Chairman
