The MI3 Group is a well-respected Eastern Canadian, leading-edge communications provider and gold branding specialists, who provides a wide range of market awareness services to junior mining companies situated in the Gold sector, and will increase and accelerate investor awareness and branding of its high-grade gold exploration opportunity, assisting the Company build shareholder value in this precious metal super-cycle"

MI3 Financieres Communications Group is an arm's length party and holds no interest, directly or indirectly, in the Company or its securities, or any right or intent to acquire such an interest, other than pursuant to options granted to MI3 in accordance with the Company and TSX Venture Exchange policies

HARRISON LAKE GOLD DISTRICT SCALE GOLD PROJECT- GOLD AND EXPLORATION HIGHLIGHTS

The Harrison Lake Gold Project contains a 7-kilometre-long ridge with diorite/ quartz bearing extensive intrusive related gold mineralization, situated near Harrison Lake, British Columbia. Historical drilling results confirm the presence of significant gold mineralization.

- The Harrison Lake Mineral claims (5,025 ha or 7475 acre) are fully road accessible from the TransCanada Highway and Highway 7 in southwestern British Columbia, with numerous secondary logging roads and related power and rail service.

- The property covers a 7-kilometre strike length of the gold rich Harrison Lake Structural Zone, with stockwork type gold mineralization within diorite intrusions (Jenner and Portal Zones) including DDH-84-52: 102 meters of 3.54 g/t gold.
- Jenner and Portal Zones include DDH 88-76 which intersected 7.0 meters averaging 21.4 g/t and DDH 88-121 which intersected 9.0 meters averaging 13.5 g/t. (Note: the intercept in DDH 88-121 is more than 50 meters vertically below the historic resource estimate and requires additional drilling).
- A corridor of similar diorite intrusions and "gold in soil" anomalies that extends for more than two kilometers to the south of the original discovery. Follow up drilling of some of these anomalies identified more diorite hosted stockwork type mineralization including DDH 88-130 which tested the Hill Zone and reportedly returned 30 meters averaging 3.0 g/t.
- The style of mineralization is similar to the gold deposits of the Tintina Gold Belt that straddles the Yukon - Alaska border and it has also been recognized that the mineralized diorite intrusions are localized along a regionally extensive shear zone adjacent to a large diorite batholith. Snowline Gold's recent discovery of the Valley deposit clearly demonstrates the potential of these types of occurrences.
- Over \$10.0 Million dollars in previous exploration drilling expenditures, with a strong Technical Team in place experienced in underground and exploration drilling for gold.
- Drilling Permits have been approved and granted by the Province of British Columbia for 2026-2027.

Michael Magrum P. Eng. is the Exploration Manager Mining, and as its key technical advisor (as a Qualified Person under National Instrument NI #43-101). Mr. Magrum will be responsible for overseeing the technical management of all Trans Canada Gold's mineral properties, and will be carrying out all requisite oversight for all new gold exploration drilling. Mr. Magrum is a seasoned geological engineer, who is recognized as professional. He prefers aggressive targeted drilling programs that have the potential to deliver multi-million-ounce gold deposits. Mr. Magrum has over 40 years of gold exploration and drilling experience, and has worked extensively in gold and mineral exploration and mining since 1971, starting his career in the Yellowknife Gold Mining Camp.

Michael Magrum, P. Eng, vice -president of mining for the Company and a qualified person as defined by National Instrument 43-101, has reviewed and approved the scientific and technical information used in this news release.
